1. Background

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-03-16 13:01:23 UTC
From: Steve
Topic: 1 Message: 1

Welcome to the group began at the release of the X1M SSB/CW Chinese radio. The list owner is currently awaiting delivery of this unit for review and operation. Some background is available at
http://www.amateurradio.com/x1m-qrp-ssbcw-transceiver-kit/attachment/201208181217487611/

Further, published specs are claimed to be:

Transceiver: X1M [v2.01]
Frequency range: 0.1 ~ 30mhz transceiver;
Modes: ssb / cw
Power output: 5 Watts (max);
Operating voltage: minimum 9.6v (dc), max 14.5v (dc);
Operating current: 0.35a (min), 1.2a (max);
Preamplifier;
Memory 100 channels ;
RIT function;
Automatic internal CW keyer
Back-light on/off
Keyboard can be locked;
Dimensions: 97 * 40 * 155 (mm)
Weight: 0.65
Receiving sensitivity: better than 0.45uV
Frequency stability: better than 0.5ppm
Frequency accuracy: better than 0.5ppm (boot 5 minutes)

An interesting additional feature says this equipment can be connected to HAM RADIO DELUXE software. The user can choose any ICOM equipment, but the IC-718 is recommended.

Welcome any comments or reviews

Steve

5. 2nd generation X1M

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-03-22 18:51:24 UTC
From: Steve
Topic: 5 Message: 5

The second generation of the X1M translated from the manufacturer's web site reveals the following...

20W HF SSB radio saddled marching communications or fixed voice confidential talk with confidentiality; with 125W power amplifier for car mobile communications, digital transmission interface can be used.
The station successfully applied to contemporary state-of-the-art communication automatically select the best channel and Automatic Link Establishment (ALE) technology, using computer control, digital signal processing, extremely excellent electronic ECCM (ECCM) performance, to ensure that in a variety of achieve reliable communication in harsh electrical environments.

The main technical indicators:
Frequency range: 2.0000 ~ 29.9999MHz (channel spacing of 100Hz)
2 types of jobs: the upper sideband, then the lower sideband, then reported
3. Frequency stability: ± 1 × 10-6
4 storage channel: 100
5 Power supply: DC 12V, negative ground.
Power consumption: The receiving state is less than 500mA, the status of the sender is less than 5A
Dimensions: 97 (mm) × 40 (mm) x 155 (mm)
Transmitter Performance
Output power: high power 20W, low power 5W
Intermodulation distortion: ≤;-25dB
3. Unwanted sideband suppression: ≤-40dB
Carrier frequency suppression: ≤-40dB

Receiver performance
Sensitivity: SSB ≤ 1_6;V (S + N / N = 12dB)
CW ≤ 0.5μV (S + N / N = 12dB)
2, the image frequency suppression: ≥ 80dB
3.AGC: 12μV signal input from the antenna terminal increases 80dB, output variation less than 6dB
4 audio response: 350 ~ 2800Hz not worse than 6dB.
Output power: Rated output 10mV

Automatic link establishment ALE performance
1. Adaptive call types: single call, network call, all call
Channel scanning speed: 5 channel / sec.
3 in accordance with MIL-STD-188-141A standard

Days automatically tune performance
Automatic Antenna Tuner Tuning time: <5S
Tuning accuracy: VSWR better than 2

Currently, the radios are only available shipped from China distributors but efforts are underway by domestic dealers to soon have the radios available. X1M price looks to be under $300US with 20 watt model tbd.

16. Radio Availability

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-03-23 17:24:16 UTC
From: kingfish_stevens
Topic: 16 Message: 16

Twelve radios, 2 kits and 10 wired, have been shipped from the factory to my office in China. They have been forwarded to the US and hopefully they will arrive next week. The kits are not kits as we usually think of them. There is very little difference in the kit and wired costs, leading me to believe a kit only requires installing the boards, screws, knobs and etc. No actual wiring.

I had not planned for the existence of this radio to be made public until I had a chance to test it myself but the cat was let out of the bag by a friend of mine. I have been working for over a month with the factory for an exclusive US distributorship for their products. This has been somewhat of a chore because no one at the factory speaks English and their production output appears to be very slow right now. Hopefully this will all work out soon.

I have already ordered an additional 50 radios but I don't know how soon they can be produced. It took two weeks to get the first dozen made.

If I have time this weekend I will put a notification list on my web site so that anyone interested will be notified when stock is available. If at all possible, I will try to have some of these for sale at Dayton. I will at least have one displayed there.

Regards,
Ed Griffin

I also haven't seen a manual. I'd really be interested in that.

One thing, if it really works with the Icom command set, I wonder if it'd work with the Millennium QSYer? If so, could be it's also accessible with this accessory. I'd be interested in finding this out myself.

It also sounds really tiny, nearly handheld by the dimensions. No KX3 killer, but at a much lower price. Definitely exciting stuff, espfor getting new hams into hf.

Just recieved this from Kight Radio:

Subject: X1M

They are not hard to put together but getting the assembled is best. They are not available in China right now. They are waiting on parts to arrive and do not expect to have any before April 20th however we are working with the mfg and trying to help them get them made before that time. Once we have them again, we will ship the first few orders from our office in China to speed things up before our stock arrives in USA.

Sincerely,
Kight Radio Electronics

Topic: 25 Message: 25

Not sure what a fair price is - depends on features , power, and quality supply availability etc.

For a multimode, multi band rig, we will certainly break the $299 price point. That's already competitive with items from MFJ 9420 and Tokyo hipower ht-750 etc. Its about half the ft 817 or ic 703, k1 and even older Tt argosy argonaut and Scout.

Someone who shall remain anonymous is planning the x1m to be sold for approx $249-$279 usd shipped by mid year. You be the judge if that's reasonable.

However, steady supplies are difficult to secure from the mfg at this time and so "talk is cheap" as they say !

Stay tuned.

Joe.

26. Import Communications - North American distributor for X1M

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-03-29 12:59:12 UTC
From: kingfish_stevens
Topic: 26 Message: 26

Steve,

I would like to announce that Import Communications has sealed the deal to be the only North American distributor the X1M and later models of HF radios.

Twelve radios (two in kit form) will arrive next week. One hundred more are scheduled for delivery on May 1. This weekend, these will be available "first come - first served" via my web site.

A 20 watt radio, known now as X1MII, will not be available until July.

I have suggested the factory consider a companion tuner/battery pack for the X1M. This would be similar to the combination that was available for the old Index Labs QRP transceiver. This combination was highly sought after then and still bring a premium price on the used market.

I am going to poll the members of this group to see if there would be interest in this tuner/battery combination. Positive feedback could help persuade the factory to make it.

Regards,
Ed Griffin

Enter your vote today! A new poll has been created for the
X1M_QRP-Transceiver group:

Would you purchase? A companion "antenna tuner / battery pack" for the X1M QRP transceiver. This would be similar to the combination that was available for the Index Labs QRP transceiver from some years back.

o Yes, I would need a tuner anyway.
o I would consider the combo instead of buying some other brand of tuner
o No, I already have a tuner or would buy another brand

To vote, please visit the following web page:
http://groups.yahoo.com/group/X1M_QRP-Transceiver/surveys?id=3137543

Note: Please do not reply to this message. Poll votes are

33. First Impressions X1M

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-03-29 21:03:54 UTC
From: Steve
Topic: 33 Message: 33

My X1M order just received this PM. I have posted a couple photos including one with the Baofeng UV-5R and my FT-817. The package included a single page "manual" in Chinese....note to Ed...you may want to get a translated version of this to include with your shipments. The package also included a speaker/mic and spare power and mic plugs. Will be rewiring the plug to a 12V supply over the weekend to fire it up. Overall I am struck by the weight and solidness of the case and visible construction and, at the same time, the small size. I can visualize all sorts of HF Pack usage. There should be a variety of existing cases adapted to work with this rig. Look forward to testing on air.

Hi,

So it says that the radio uses the Icom command set. Does it also use the same data cable as Icom? (Checking for possible use with the QSYer, http://www.qsyer.com)

I'm also supposing some standard power plug? Hopefully? Standard 2.1/5.5mm connector would be fantastic, i.e. same as MFJ/Elecraft/others. It would make my life easier, anyway.

Looks to be standard 9 pin serial rs 232. I have a serial to usb adapter will be trying. The HRD command set for the IC-718 is the claimed function. Believe you are correct on the power plug. I do know it is not the same as the FT-817 plug

From: kf9cm
Topic: 36 Message: 36

Hi,
I'd like to say hi to the group. I purchased a X1M transceiver and received it today. I tested it out on the bench and I only found two real problems with it.
First, I had to change out the SO239 connector to an American made socket. The threading on the original was too tight and would not accept a PL259. Second, there is very little documentation. I went through most of the operations by trial and error. I e-mailed Mr. Yan at the factory to obtain a manual and schematic. Hopefully I will get a response. All in all it seems to be a pretty good little rig and the price was right.

I don't really see how one could construct this from a kit with the amount of documentation you receive.

39. Orders now being accepted

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-03-30 02:57:47 UTC
From: kingfish_stevens
Topic: 39 Message: 39

I have now added the X1M to my web site and will take orders for delivery in early May.

The first 5-6 orders will get delivered next week from inventory that arrives next week.

Regards,
Ed Griffin

From: kf9cm
Topic: 41 Message: 41

I uploaded, to the files section, the 2 page instruction sheet that came with the X1M transceiver. I found in order to tune and change frequency, push and hold the main tuning knob for about 1 second. you will see an underline on the digit you wish to change. If the digit is underlined as you turn the knob it will switch digits. If the digit is darkened. turning the knob will change that digit. I hope this helps.

If you push and hold the RIT button You will go in the perimeters menu. Be careful if you change some perimeters you will do like I did and (for some reason) the receiver gain will be cut in half. I guess I will have to wait for a translation to bring it back up.

I will do some more investigating and I'll let you guys know.

I love how on the manual it has WARNING written in English but the rest is in Chinese.
I watched the videos on youku that were mentioned and they explain how to work the radio.
So far I like the radio but I don't know if I would give $299 for it, will it go out of band such as for mars? I can buy a used 100 watt rig for around $300 and it will have AM and go out of band as well as other features the X1M doesn't have.

Attachments: 1 described; binary payloads are missing from this source WARC

it's not practical for us to buy in the US, we don't have taxes on ham gear
and the price in the US is much higher than the one in China not to mention
the delivery cost from the US which is outrage ! therefore I am looking for
the Chinese source.

This rig could be useful as a signal generator-type
source and/or with transverters.

IF ... the power output may be lowered.

Thanks!

I am planning to distribute directly from hkg or china. My proximity to the supply source gives some advantages in terms of supply availability including spare parts as well as pricing.

Shipping arrangements being worked. So stay tuned for details including where I will sell to/ ship to, pricing, etc.

Price anticipated to be approximate $219 usd plus shipping fees per unit

I will not be shipping into the USA initially as there are existing distributors for that market.

Joe. K7JOE/BY1.

The ad can be confusing. It does continuous RX & TX 0.1 - 30MHz PLUS for some reason has additional Ham segments. Perhaps extra filtering there?

Extra filtering is correct. I just changed the description to reflect that. As for the frequency spread on those separate segments, I will have to ask about that.

60. Re: Frequency Ranges

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-04-06 17:13:56 UTC
From: Bruce Buhler
Topic: 55 Message: 60

So does that mean the radio has continuous TX and TX between the designated limits, but also has 5 filter ranges B1, B2, B3, B4 and B5 for the 5 specific ham bands? Operation on 12, 17 and 30 meters is therefore also permitted?

I hope I now understand the M1X frequency capability.

My small radio is an SG2020 capable of up to 20 watts. The FT817 is only marginally smaller so an even smaller radio is of interest to me.

Definitely this radio represents appreciated size and price innovation and I look forward to practical experiences and technical reviews from those who have purchased and received this interesting radio.

Bruce,
KD6DRU

It appears so, yes.

Also, word is of this 5w rig, followed by a 20w rig, then
supplemented with a 125w external amp. That would be clever
market positioning.

From: kingfish_stevens
Topic: 55 Message: 62

Yes, TX on all ham bands and MARS frequencies via the main VFO. The 5 dedicated bands are separate and have optimized filtering. I don't know if the limits of the dedicated bands can be changed or not. Even if the limits can be changed via firmware, I'm not sure how that would interact with the filtering. I have asked the factory about this.

63. Linux-based remote rig operation?

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-04-06 17:22:53 UTC
From: qrv@kd4e.com
Topic: 63 Message: 63

Q: Is there a Linux-based app for remote rig operation via
the Internet, a long cable, and/or RF-link e.g. 220, 900MHz,
or http://broadband-hamnet.org ?

Many Hams have switched to Linux for reasons of customization,
use of older PC's, Raspberry Pi's & others, & cost.

In emcomm is it often difficult to position effective HF
antennas close to the EOC or other command & control location.

If a rig like this could be remote-sited and remote-operated
that would be really handy.

Not exactly. The 20 watt rig is being developed but will not be in production until the end of the year. A companion 100w amp and auto-tuner are planned but will most likely come some months later. This is a small company guys so don't expect too much to quickly.

It's fun to look ahead!

Sure wish TenTec would team with TI and do something like this.

If they can relocate Raspberry Pi manufacturing to Britian and
remain cost-effective surely the US could reclaim some high-
tech manufacturing as well.

Sigh.

This is one of the prototypes for the X1M second generation now referred to as MKII which (as Ed has mentioned) should be available around year end or early next year.

74. New poll for X1M_QRP-Transceiver

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-04-08 13:25:44 UTC
From: X1M_QRP-Transceiver@yahoogroups.com
Topic: 24 Message: 74

Enter your vote today! A new poll has been created for the
X1M_QRP-Transceiver group:

Need every member's input on this poll as quickly as possible
please. Antenna connectors on Chinese radios seem to use
metric threads that do not mate well with US PL259 connectors.
They will only screw on part way and have that cross-threaded
feeling. Which connector would you prefer?
Thanks, Import Communications

o Chinese SO239 even if metric threaded
o BNC Female that accepts our common push & twist BNC male connector
o Absolutely not the BNC

To vote, please visit the following web page:
http://groups.yahoo.com/group/X1M_QRP-Transceiver/surveys?id=3138500

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

75. Antenna Connector - Poll Options?

Yahoo group: X1M_QRP-Transceiver (2013)

From: qrv@kd4e.com
Topic: 75 Message: 75

o Chinese SO239 even if metric threaded
o BNC Female that accepts our common push & twist BNC male connector
o Absolutely not the BNC

There are two missing alternatives:

() Standard SO-239

() N-Connector

In order of preference I'd prefer Standard SO-239, then BNC Female,
then N, then Chinese/Metric SO-239.

IMHO, YMMV ... :-)

Topic: 55 Message: 82

I hope it does because it would be nice to expand where that filtering is. Looking closely the frequency segments closely resemble the primary allocations in the ITU Region 3 band plan.

They're kit radios so I doubt there's any warranty other then what the distributor offers. My guess is they're getting them past customs by importing them in as kits and assembling them locally.

Anyone know if its linear so I can scan the bands by spinning the dial or do you literally have to go through the procedure of setting each character to QSY? I think for me that would be a deal breaker if it wasn't linear after I read how you set the memories.

Since I am thinking WTSHTF for this tx/rx, the more coverage, the better. Once the commercial stations go belly up, 5w might do a great job. Think of air with NO commercial TV/radio transmissions.

If I understand your question correctly I would say tuning is linear. You highlight the frequency digit and you can linearly go up or down from that point with corresponding digits to the left and right reacting as they should as you cycle to the next 10's. Am I making sense? I have the radio.

Ha ha ha ha. Or, in our jargon, hi hi hi hi. My thought is that someone would like to make some money on this, and we all talk to each other a lot. So if the first issues are bad, sales halt and no profit to be had.

That will keep things above board for a while, at least. These will be well made units and if they arrive DOA they will be apologetically exchanged, I'm certain.

91. Definition of "kit"

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-04-09 10:28:54 UTC
From: myndzblank
Topic: 91 Message: 91

My X1M "kit" finally arrived, and it is not what we all expected. I think we were expecting an Elecraft KX3 - style kit with no soldering involved, just fitting the boards together and assembling the hardware.

Unfortunately, when I opened the box, I was greeted with bags of thru-hole parts, and all of the connectors. This wouldn't be too intimidating except for the fact that there was no board layout or assembly guide. Not even a chinese one.

I'm not afraid of soldering really, but I haven't done anything like this in about 30 years, and I think I need to practice on something a little less complex, and with some instructions.

I think we were expecting a "snap-together" type of kit because of the relatively small difference between the kit and assembled prices ($30).

Oh well.

I have worked something out to get an assembled version. More to follow.....

From: Papadad
Topic: 92 Message: 92

Yes the threads between the Japanese PL259 and amphenol PL259 are different.

A quick and easy solution is of course a Japanese pl259 to bnc (or any variety) RF adapter.

The other is to use a Japanese pl259 on your coax... Available from many sources online eg eBay.

You can also change the connector on the chassis. Yes there is adequate room in there to make a change to any variety of rf connector.

Joe

Import Communications will be in the North Hall
Spaces 175-176. Directly across from The Wire Man.

I will have the X1M on display. The number for sale depends on
how many are left after filling orders from those already pre-sold.

I think this is a good idea, especially considering that BNC has sort of become the de facto QRP standard. Not to mention all of the single band whips (and the big ol' honking' multi band one) that have BNC connectors.

Christopher,

I'm guessing that the LDG Z-100 Plus would work well. It handles from 100mw to 125 Watts. They sell for around $150

I ordered an Emtech ZM2. Not auto, but supposed to be one of the best QRP tuners. I'll post my results when I finally get it all together.

Planning on using a random wire with a Balun Designs 9:1 QRP UnUn out in the field, and the aforementioned ZM2. For power I went with an 8-AA battery holder and 8 Eneloop rechargeables for now.

103. Part 97.307 (d) Harmonics & Spurious Emissions

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-04-09 22:50:57 UTC
From: qrv@kd4e.com
Topic: 103 Message: 103

Does the X1M comply with Part 97.307 (d) or is that up to the operator to determine & remediate if not?

I get that a "kit" may be held to a lower standard but the X1M is now being marketed as an assembled rig.

FCC licensed Hams in the USA are responsible for any rig they operate to meet those specs, not the manufacturer, but in the past the FCC required rigs to meet the standard prior to permission to sell.

Part 97.307 (d) "the mean power of any spurious emission from a station transmitter or external RF power amplifier transmitting on a frequency below 30 MHz must be at least 43 dB below the mean power of the fundamental emission."

Just wondering ...

Should be able to add this feature ...
I have this X1M over a period of time I will do it
But recently busy: (

Is the X1M already being sold in Shanghai? My son will be working there and I may go see him there. How would I find a "ham radio" store which would sell one and would they sell it to me? Anyone know the local cost in Chinese Yuan?

Just wondering if there are any user reports concerning how this radio performs. Its oddities, and issues, if any.
Hopefully someone will have actually received theirs and can report on their real world experience with it.
Thank you.

Have been trying to buy one and don't think the distributor(s) have received any yet. Have ordered one from Ed but haven't heard anything new yet. (Ed from Import Communications). It looks like I (we) will have to wait until early May. Anyone have any news about the X1M?? (Ed translated the manual and posted it on his web site. Here is the link: http://wouxun.us/Manuals/X1M_English_Manual_v2.pdf

Gary,
That was a fine U tube on that rig
CW sounds great.
Just the QRM ruined the SSB part.
What is the band width on that rig for CW?
Some hams have been working really good DX on 20 meters @5 watts with a small mag loop.
BOB AF2Q

Gary,
Thank you so much for taking the time to make that video! It gives us a better understanding of its performance and sound.

Maybe after you have used it on the air for a week or so you could just post a message of what you like and dislike. And/or any problems you have uncovered. No need for another video, (But always welcome) just a little report of your user experience.

Thank you again for your efforts.
Ken

119. Hello group and WOW

Yahoo group: X1M_QRP-Transceiver (2013)

From: fred
Topic: 119 Message: 119

Hello from thunder bay Ontario , name is Fred and call is VE3FAL.
I am a tester and do reviews on a number of radios and antennas and have today did a quick review of teh latest X1M, last review I did was in August of 2012 and the radio needed quite a bit of work, but today the X1M is all that and more, great job.

I had the opportunity to beta test this radio last August when it was first being introduced. It had many little things that needed to be addressed. I just received the newest version and all I can say is WOW, spot on. I plugged the unit in and put power to it and put it on 20 meters into my windom. I heard W4LVP in TN calling CQ on cw,I answered and he heard me first call, gave me a 579 into TN. Many nice changes to the radio that will make this a real shopper stopper on the market for the price. Additional items like adjustable sidetone volume and filtering for cw and phone would be great, as well a small S meter or power meter on the display would be good, but not actually needed, if you can hear the station the radio is working. The unit is a solid 4.5-5 watts across the band. Fred VE3FAL

120. My first impressions of the X1M QRPp Transceiver

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-04-23 00:54:40 UTC
From: Papadad
Topic: 120 Message: 120

I also received my X1M from the manufacturer yesterday. I will do a written review, while video would be better, youtube is blocked here and so I did not bother to make a video, play with the VPN to upload it, etc. I can do that during the weekend.

Initial opening the box observations:

Unit arrived in bubble wrap, no outer box or other packaging. Instruction "manual" is 1 page front and back printed, which gives basic specs and menu functions - good enough that even an inexperienced ham could be up and running. The units that I am procuring are fully assembled, not kit form. The box contained the radio as well as a hand microphone wired for the radio. It also included a phono jack for CW key (wire yourself) and a power jack (wire yourself). I wired the power jack, plugged it into the ps and the radio and turned the radio on -- nothing. OK, quick inspection of the power plug reveals that the barrel is too wide and the pin is too narrow - the plug fits snugly into the jack, but the inner barrel does not connect to the inner pin. I unplugged my AT-100 auto-tuner (that is wired with similar barrel) power jack, plugged it into the radio just to try things and the radio turned right on.

Radio is light weight. All metal enclosure and looks to be well shielded. Rear panel of my unit has "metric threaded" SO-238 RF connector, and I was able to find some PL-259's that fit just fine. The Amphenol connectors that I have did not fit well...so...it's easy to swap out a different rf connector, or get a simple adapter with the right threads to convert it to N-connector or BNC connector etc.

Radio has a small built in speaker. Volume/audio is adequate but not super loud - probably better with external speaker or use headphones. While the mic looks identical to a ht speaker-mic, it is not wired that way and thus is used only for TX audio. The mic has a red LED on it when in TX mode to show transmit. The LCD display will also show a T or R icon when in transmit or receive.

Initial operating observations:

Radio has a built in preamp that really helps receive. The sensitivity is around 0.45uV which is less sensitive than my FT-857 -- i dont have other QRP rigs to compare it to, but it's not in the same class (price or performance) as a K1, Scout, 817D, etc anyway so i suppose it is really more than adequate. There are dedicated bandpass filters that switch in and out and those seem to really help selectivity (as expected with an SDR).

Tuning - the first thing you will want to do is spin the dial. OK, the VFO knob feeling is clicky clicky knob, think of it like a "select" knob on the 817/857 or Alinco DX70 radio if you are familiar with those. Or, if you have owned QRP gear, think of it like the Uniden 2510/2600 or RS HTX-100 main tuning knob. It is not a "smooth VFO" knob. The knob clicks. And, like every other knob of this design , it too occasionally skips a beat or two, so you have to watch the VFO when tuning up or down band. I would have preferred a smooth vfo tuning mechanism, but can't have everything. The VFO knob has rotate function and a push in function. The push in function is used to "set" certain parameters, such as tuning step once the step has been selected.

The LCD display is green backlight and fairly easy to read considering small size overall of the unit. Frequency is the main use for the LCD display, as is TX or RX function, pre-amp on or off.

There is no S-meter or RF(output) or SWR meter on the LCD display unit.

Tuning resolution can be set to Mhz, 100 Khz, 10 KHZ, 1 Khz, 100 Hz, 10 Hz, and 1 Hz. Yes -- pretty remarkable but remember this thing is all DSP driven. 1 Hz resolution is probably overkill...but anyway, it's there if you need it. It's a little

Modes are USB/LSB/CW. No AM or FM or FSK. You change modes with one of the front panel push button switches. Pushing and holding one of the switches will put you into Menu mode. Pushing and holding other switch will turn the preamp on or off.

You can set the BFO frequency for these modes within the setup menu (9 menus are available for various tweaking, mostly dealing with the SDR aspects of the radio.

There is no obvious POWER OUT or MIC GAIN or ALC adjustment as noted previously..

I am mostly a CW op and the bandwidth in CW mode is fairly wide ... maybe 1800 Hz bandwidth. Did not have time for measuring it but it is certainly not a narrow filtered receiver as judged by my ham ear.

On SSB it plays nicely and was listening to some of the Sichuan earthquake H&W traffic last evening.

I like the gen coverage receive, but without AM detection, it is just so-so listening in on the shortwave bands unless you zero-beat and eliminate the heterodyning. Good news is that the DSP is super stable so the thing doesn't drift like the old capacitance style vfo's.... had to keep one hand on the tuning dial while listening to London...Once set you can at least hear and understand the broadcast (bandwidth a little narrow for AM too)

Have not done much advanced testing - sensitivity, selectivity, audio and power out, etc... will report more when tests are completed.

I feel it's important to represent this rig as it is.... not mislead. Share positives and negatives... provide feedback to manufacturer for improvements, etc. The unit I have, is serial number X0087...white glue on sticker. Would be interesting to compare production differences with others.

As indicated previously, I have placed an order with the manufacturer and will keep posted on committed delivery dates to me, and then onward shipping, pricing, etc. for those who expressed interest.

More to follow.

Joe K7JOE/BY1

Papadad:

I had to fix the tuning knob as I was not able to press it in to select. Once that was done I was good to go.

I have made some videos tonight and will post on YouTube, was listening to W1AW earlier and very nice signals, will tune a shortwave station tonight and see what that sounds like, was listening to a shortwave station on 13 megs today and like you say it is good once you get used to listening to it..

I can post both of my reviews from last August and the short one from today if that is ok, maybe folks don't want to see the August one, but what I can say is they sure have made lots of good changes.

Fred

Ok gang I have uploaded both of my tests and reviews into the files section. Only things missing from the first review are teh videos and pictures as they would have been way too big to put into the files sections.
As you will see this little unit has come a LONG way since August.

Enjoy....

Thanks for a great overview!!!
We hams will zero in on this thing in no time at all. I hope the tune encoder has a longer life than some on other low end equipment. It seems there are both good and not so good low cost encoders available. Time will tell.

Initial operating observations:

Radio has a built in preamp that really helps receive. The sensitivity is around 0.45uV which is less sensitive than my FT-857 -- i dont have other QRP rigs to compare it to, but it's not in the same class (price or performance) as a K1, Scout, 817D, etc anyway so i suppose it is really more than adequate. There are dedicated bandpass filters that switch in and out and those seem to really help selectivity (as expected with an SDR).

Tuning - the first thing you will want to do is spin the dial. OK, the VFO knob feeling is clicky clicky knob, think of it like a "select" knob on the 817/857 or Alinco DX70 radio if you are familiar with those. Or, if you have owned QRP gear, think of it like the Uniden 2510/2600 or RS HTX-100 main tuning knob. It is not a "smooth VFO" knob. The knob clicks. And, like every other knob of this design , it too occasionally skips a beat or two, so you have to watch the VFO when tuning up or down band. I would have preferred a smooth vfo tuning mechanism, but can't have everything. The VFO knob has rotate function and a push in function. The push in function is used to "set" certain parameters, such as tuning step once the step has been selected.

The LCD display is green backlight and fairly easy to read considering small size overall of the unit.
Frequency is the main use for the LCD display, as is TX or RX function, pre-amp on or off.

There is no S-meter or RF(output) or SWR meter on the LCD display unit.

Tuning resolution can be set to Mhz, 100 Khz, 10 KHZ, 1 Khz, 100 Hz, 10 Hz, and 1 Hz. Yes -- pretty remarkable but remember this thing is all DSP driven. 1 Hz resolution is probably overkill...but anyway, it's there if you need it. It's a little

Modes are USB/LSB/CW. No AM or FM or FSK. You change modes with one of the front panel push button switches. Pushing and holding one of the switches will put you into Menu mode. Pushing and holding other switch will turn the preamp on or off.

You can set the BFO frequency for these modes within the setup menu (9 menus are available for various tweaking, mostly dealing with the SDR aspects of the radio.

There is no obvious POWER
OUT or MIC GAIN or ALC adjustment as noted previously..

I am mostly a CW op and the bandwidth in CW mode is fairly wide ... maybe 1800 Hz bandwidth. Did not have time for measuring it but it is certainly not a narrow filtered receiver as judged by my ham ear.

On SSB it plays nicely and was listening to some of the Sichuan earthquake H&W traffic last evening.

I like the gen coverage receive, but without AM detection, it is just so-so listening in on the shortwave bands unless you zero-beat and eliminate the heterodyning. Good news is that the DSP is super stable so the thing doesn't drift like the old capacitance style vfo's.... had to keep one hand on the tuning dial while listening to London...Once set you can at least hear and understand the broadcast (bandwidth a little narrow for AM too)

Have not done much advanced testing - sensitivity, selectivity, audio and power out, etc... will report more when tests are completed.

I feel it's important to represent this rig as it is.... not mislead. Share positives and negatives... provide feedback to manufacturer for improvements, etc. The unit I have, is

serial number X0087...white glue on sticker. Would be interesting to compare production differences with others.

As indicated previously, I have placed an order with the manufacturer and will keep posted on committed delivery dates to me, and then onward shipping, pricing, etc. for those who expressed interest.

More to follow.

Just worked 2 folks on the eastern seaboard, but qsb is bad today.
Worked Frank N3RSD in DE at 559 both ways and just finished with Jerry K2PAY who was a 339 in NY and I was the same.

Solid 5 watts out into dipole....So far on CW the little rig is performing well.

Have yet to give SSB a good workout.

Hi Fred

I do not have one of these rigs and I guess I am telling you how to suck eggs, but.

If I recall, there was an earlier post that said the X1M was compatible with the IC718 for HRD. Have you set HRD up for that?

Howard the egg is hard boiled so it wont break and get all over me..

Yes I have set up for the IC-718, put all parameters in automode to find com port and baud rate and still no go.

I have tested all cables and gender benders to make sure they work with other rigs and no problem.

I am testing and reviewing the rig for a write up and wanted to test the computer control.

The cw mode works great and worked Italy on it today, I am waiting for the local 80 meter net to start to test SSB as I was told yesterday that the mike audio was over driven.

Ok, back to boiling more egss until I get an answer..

But one problem is there is nowhere to set comm. Port baud rate on the radio.

Wish I could ask BG8HT what I need to do?

Topic: 132 Message: 132

I had a bit more time to give the X1M a bit more of a workout. As a receiver, it does a fairly nice job, very stable, and small/compact.

Sensitivity in the ham bands with the preamp on is very good... i could easily dig out signals when not faced with QRN. The rig is noisy.... no noise blanker, so probably best on the side of a mountain in middle of nowhere...running on batteries.... etc.

I added set of 4 small rubber feet to the under side of the cabinet...it is light and easily slides around with the mic cable movement.

On SSB, you need to position the hand mic just right to be able to get good audio drive. The mic is plenty sensitive, the audio sounds quite good on another rig (listening to myself) but i noticed how you hold the mic across the mouth / positioning makes a huge difference in how the radio is driven, ie, power out max.

Power - on 1.8V regulated power, I was getting 4 watts out into dummy load on most bands including 10M.

As a cw op, the CW wave form is not as crisp as my FT-857D. The rise and fall of the dits and dahs at around 25 WPM (using built in keyer) sounds a little bit mushy, not crisp especially on first note of a character.... This may be a function of the keyer versus the RF keying relay/speed characteristics of the radio itself. The built in keyer is a nice feature, for sure, but it seemed like the dot / dash ratio was not exactly 1:3 and is not adjustable... Certainly it is tolerable, and ... distinct... but not as crisp as other radios. On receive, the T/R transition time is adjustable and I found at around 0.2 seconds when running about 25 -30 WPM CW was reasonable to avoid relay chatter but to open between words for semi-break in operation.

More to come.

No noise blanker.... Could limit versatility as a in vehicle mobile rig - It is tiny... Putting it in-dash with a solid state 150-400 watt amp under the seat seems like an interesting idea. Especially with 5 watts SSB output, this rig can drive the many "hf" mobile amps that are on the market just fine.

The total harmonic distortion of audio especially at highest volume levels is being investigated. It May just be small internal speaker size. It Does not seem as distorted when an external speaker is in use.

Agree Joe..I think it is just speaker size as well, and make sure you have adequate power to it and not running a wall wart as you hear some pretty interesting sounds if you do.

NB, Filters for SSB and CW.otherwise not sure at this time what else it could need or should have.

Only thing is for a good amp you pay good $$$, so for the radio and amp you would be close to the price of a FT-718 but again it will not fit in the dash.

So a bit of win some and lose some..

This radio would be a great match for the HF amp that was in QST I believe in June of 2011 issue. That amp used cheap 98 cent switching transistors to produce 50 watts. Less on 10 meters but still a nice match for this little HF radio.

I built this amp when the magazine article first came out. I made my own board to fit in the small area where the power amp sits in an old Yaesu FT-7. It worked very well.
It is very cheap to build and very cheap to repair. The gain/output is reduced at the higher frequencies but perfectly acceptable for determined QRP operators. I made a driver stage from an old CB transistor (2166) and was able to drive it from the 5mw out of the FT-7 driver stage.

Hi Guys, just got my X1M the other day. What type of interface cable are you all using? The one for FT-817 has a DIN connector. This one uses a serial connection.
Thanks,
Mark....KV8T

Tried a few different cables and gender bender here and different software, none will work. Need factory made cable.

That has also been updated on the webpage when ordering radio.

Mark:

Hello from Thunder Bay Ontario….

I got my X1M from Ed at import, I am beta testing the unit and putting it through the ringer as they say.

I tested the first version back in August 2012 and the little radio had lots of potential but needed lots of little tweaks for all the horsepower under the hood.

I can say that this radio has come a long way since August 2012…It could use a few things still like cw and ssb filtering but it has proven well for me on cw, did some ssb tests today and it seems fine for 5 watts depending on propagation of course.

Ed will not steer you wrong so enjoy your X1M.. Not sure when full blown production takes place.

Cheers

Fred

So then, is consensus that it *doesn't* use a standard RS232 type connection? Or does it, but they've purposely buggered the wiring so you have to use their cable?

I'm suspecting a lack of front panel controls, so eyes-free operation without a computer would be kind of difficult. However, this may be motivation to learn something useful and work out something with say a Raspberry Pi and Espeak or morse output or some such thing. This would seem possible if it really uses the Icom command set.

Buddy:
I tried various cables, gender changers, and software, none would communicate or handshake with the rig.
One thing that is missing is the communication speed or baud connection.
Now, with that being said, maybe RS232 is not a good item to have on this radio and should be a USB connection?

I am trying to throw some ideas around here, definitely computer control of the rig would be a great asset in the shack at home due to the size of the rig and display. I t would make band and frequency changes a bit easier as well I would suspect.

One thing that I noticed is that you can't go from a memory channel to that band by going to the vfo, the vfo will take you to the last frequency you were on, I say this because if you are on a memory channel on a FT857 spin the dial it will bring you to VFO mode for that frequency.

So then, is consensus that it *doesn't* use a standard RS232 type connection? Or does it, but they've purposely buggered the wiring so you have to use their cable?

I'm suspecting a lack of front panel controls, so eyes-free operation without a computer would be kind of difficult. However, this may be motivation to learn something useful and work out something with say a Raspberry Pi and Espeak or morse output or some such thing. This would seem possible if it really uses the Icom command set.

Hi Fred,

For my specific need, i.e. control and readout available non visually, with morse or synthesized speech, of course a computer would work, but having something as portable as the rig itself would be even better. Fortunately (for me, anyway, since I'm not very smart), it appears that a lot of the heavy lifting may already be done, if interfacing to the Pi can be accomplished. It has two USB connections (I think) plus lots of GPIO pins. I suspect the computer end of the cable for this thing *is* USB, but does it have a USB to serial converter in it like most of the handheld radios have? Time will tell, I suppose. But it looks like someone has gotten ham lib to work, so making that output to synthesized speech or morse would be the interesting bit. I guess. Should be an interesting project, anyway, especially if the accessibility can be done with cheap hardware, and it doesn't get a lot cheaper than the Pi.

So, I guess I have o get myself a Pi next.

Topic: 128 Message: 149

Hi Fred and Buddy,

I don't have a rig yet to test my theory out but I'll share it with you in case one of you hasn't tried it yet and wants to. If you've already tried it and it doesn't work -- drats. Otherwise my reading about the Icom-718 and a limited knowledge of serial port communication makes me think...

It uses a TTL level serial port running at 1200 bps.

Here is the longer reasoning....

1) The rig probably uses TTL level serial communications (0v-1v range & positive voltage as the "1"; negative voltage as the "0") b/c most rigs seem to
2) While the serial port on a computer dumps out RS-232 levels (something like -13v to +13v and negative voltage as the "1";positive voltage as "0")

So I'd expect to need some serial port level converter (Rs-232 to TTL) for it to work if you were coming out of a standard serial port on a computer. And if you are using a generic USB Serial Cable I suspect it would talk RS-232 but if you are using one made for a ham radio I'd expect it to do TTL by default. But alas I don't actually know.

As for baud rate the Icom CT-17 which is the device the Icom-718 uses for remote command uses a 1200 bps rate. I'd expect software that has predefined "Rig Profiles" to include the baud rate of the communication for each rig (but I could be wrong -- I've never tried). Therefore, I'd expect the baud rate to be the same as the Icom-718.

With all that being said it could be a funky pin out on top of it all or nothing like it.

Hope my thoughts can add more fuel to the fire and not just be a repeat of whats already been done/said. I look forward to getting mine soon so I can report success or failures instead of just theories!

150. A weekend with the Xiegu X1M

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-04-29 19:06:12 UTC
From: myndzblank
Topic: 150 Message: 150

This is a copy of my post over at AmateurRadio.com

So, I have now had the X1M since Friday. I have to say that overall, I like it. Friday night I checked in to the Brothers Net, and was heard clearly in Virginia, and again on Saturday night, when one of the members in Virginia relayed my check-in to the operator in Maryland. Also on Saturday I logged 5 of the 7 Florida QSO Party spelling bee stations from my living room, as well as a couple of other Florida stations. Reports ranged from good for QRP, to Wow! Only 5 Watts? Keep in mind this is in a much-less-than-ideal setup.

In our apartment, KD2CHE and I are extremely limited on space, inside AND out. The X1M is attached to an L-shaped random wire in the front yard, by way of a Balun Designs 9:1 Unun, and an Emtech ZM2 tuner. Emtech recommends not using an additional balun or unun, but it seems to perform a little better with this crazy antenna.

It tunes up on most bands, and appears to tune up on 75, but signal reports were bad on 75, with a lot of RF feedback, and I can hear myself in the speakers I have attached to our TV when I transmit. 17 meters seems to be an issue with the TV speakers as well. I'd love to put up something better in the front yard, but we'll see what the landlord and neighbors are willing to put up with. 160, by the way is a no-go, but I don't think that's a surprise.

I've gotten the hang of using the X1M pretty quickly. I haven't used the memories yet, but I use the dual VFOs quite a bit, as well all of the different tuning speeds. Everything is fairly straight forward once you get the hang of it. Audio is what you would expect for a radio of this size (this thing is SMALL!), and fine through headphones. The receiver is very sensitive. I'll get some actual numbers next weekend. I like that you can kill the display light to conserve batteries, which will help when portable.

I've tried battery power. With 8 alkaline AAs the radio seems to perform OK, however, 8 LiIon batteries are not quite enough voltage for the rig, producing some howls and distortion with the volume above about 40%. I guess I'm not too surprised at this, since 8 FULLY charged AA Eneloops only put out 9.6 volts. I will supplement that with 4 more Eneloops in series for a max of 14.4 volts. Later on, I can pick up something a little more sophisticated. I also made a coax-to-powerpole cable for mobile use, so I can always just set up next to the car when needed.

A coax power plug for making your own power cord, and a 1/8″ stereo (3 cond) plug for wiring to a key/paddle are included. The power connector is a very common size, 5.5mm OD x 2.1mm ID, or Radio Shack size M, which made powering the radio up easy, since I had a size M-to-tinned-leads cable already. I wired a straight-key up to the 1/8″ plug, and had to set the keyer mode to manual, which was also not hard to figure out. The instructions are in Chinese, but an English translated manual is available from Import Communications, or in the X1M Yahoo group.

I think the little X1M has a nice future in my collection. It's no KX3, but for about $300, it's a nice little radio.

To be continued ..

Neil great review.

That might explain why I was having trouble being heard on 80 meters as well, but I still do not rule out net control lack of experience as I was heard about 3.5 hours west of here when the NCS in the City had a hard time making me out..

I had my manpack radio outside on Saturday and played in the 20c temps all day.I had my friend listen and talk to me from outside on 40 meters using SSB and he said the radio sounded good on SSB. I had to hold the mike at breast height and talk, he said if I held it closer that it was HOT for sure.

I sure can't knock it for cw though, as CW is my forte and I have no use for SSB at any time.

I agree it is a great little performer and the more that we experiment and play the more we will know what this rig needs to make it the ultimate portable radio.

Hopefully I'll get to try it on CW sometime soon (learning). The issue with 80 Meters I think was more of an antenna issue on my part.

I'm used to holding a mic pretty much in my face. I'll have to have someone check it out if what you're saying is the case.

Enjoy!

I added the X1M to the reviews section of eHam, and gave it a 4 out of 5.

154. S Meter?

Anyone know if an S Meter is going to be included on the display as a mod update?

An S meter has to be a must before I would really consider this radio.

I doubt there will be any updates, so no S-meter. I'm curious as to why no S-meter is a deal killer and if others feel the same way?

An S meter I can live without, I usually go by hearing when I give an honest report...if an S meter were incorporated it should also indicate power output, or some form of high swr indicator, that to me would be more information and something I could use that would save the radio finals.. But that is my .2 cents worth.

Not too many of my qrp rigs in the past had any form of S meter.

Thanks

I'm as curious as you, Ed. I've been operating for 25 years effectively without an S meter (I'm blind, so can't read the ones that are in my radios anyway). Ears work great for that. Use those instead. And what do you want for $300 anyways?!

LDG sells an outboard SWR/PWR meter for the FT-857.

Yaesu is still selling the FT-857 and for a whole lot more than
the little Chinese QRP HF box.

Not at all. I have had my X1M for about 2 weeks now and love it. What is so important about an S meter? Everyone is 5-9 aren't they? You can always pay $500 more for a FT-817, that's an very expensive S meter.

Guess if you 'had to have' an s-meter, you could tack into the AGC line
& do some twiddling there.

Sounds like the start of a 'Mods and Enhancements' group? hehe

I'm not at all sure that lack of S-meter is what is putting me off about the X1M. I am sure lack of ALC indication (if there is any ALC!) or output power indication is. I definitely want to know if I am over or under driving the output transistor(s).

There is no need as ALC or output power are not adjustable. I always get great signal and audio reports on mine.

Topic: 154 Message: 164

Mark,

"There is no need as ALC or output power are not adjustable."
Isn't that the point? How do you know if your are speaking too loud or too quiet? Wait for someone to complain? My concern is more about properly adjusting input level for digital mode transmission. I like the idea of a small light transceiver for portable use. Having to take additional monitoring equipment along to set transmit levels kinda negates that advantage.

When I get mine, I'll probably use the LDG Z817 that I have for my FT-817ND. Otherwise, a manual one -- MFJ-902 and an SWR bridge.

IIRC, somewhere I saw a MiracleWhip <gasp> connected to an X1M. However, I did not recall seeing an SWR bridge, or the like. What was done to tune the whip? Just noise, or had it been tuned with an SWR bridge, and the setting marked (this is what I do with mine)?

Also, has anybody received one of the new ones? BNC, or UHF connector? I believe the photo with the MiracleWhip was done on one of the earlier ones with the UHF connector?

Hi Paul,
From what I can gather, the MiracleWhip device is a multi-taped Toroid device with a 2 foot antenna.
At 3.5 MHz it takes a 410uh loading coil to match that 2 foot whip and all this with a Radiation Resistance of .021 ohms.
IMHO it's going to be a miracle if you get a QSO. [:D]

I thought they were out of business.

It is a tapped toroid, but the whip extends to about 5'. I have made a small dot with paint for each band for quicker tuning.

That is a good idea. Believe it or not, I have gotten an RF "bite" on my FT-817ND when using the Miracle Whip antenna on a picnic bench once. Counterpoise/ground should help a lot.

But, back to the original question -- what is being used to set up the SWR for the MW? For the FT-817ND, it has a built-in SWR meter of sorts. I am thinking of using the QRPKits bridge, or their SOTA tuner, which has one built in.

Also, what is the experience with the X1M as a general coverage receiver?

Paul:

I have been using mine hours at a time both on the ham bands and listening to shortwave, it works well as a shortwave receiver, once your ear get tuned to the unit it sounds great.

I find USB works best but again it will depend on ones ears and tuning.

Yes and the newest batch will have the BNC connector. My experience with the foreign bought SO-239s are they can tend to be threaded poorly and will cross thread. Many of the connectors can be very tight.

Please, guys, QRP takes more skill than 100-watt (or higher) transceivers.

It is challenging enough to make QRP contacts when you are using an efficient antenna, such as a resonant half-wave dipole.

The Miracle Whip is a cute idea and, yes, people can make some contacts with it when conditions are particularly favourable. But people can make some contacts using a dummy load as well. And a 50 Ohm carbon resistor is a whole lot cheaper and more convenient.

There is a very telling Antenna Shootout on the hfpack.com website. It is well worth checking out their comparison of various vertical and horizontal antenna models, including the Micacle Whip - and a dummy load!

Gang I have shared a few small videos taken with my BlackBerry this week to some of our members. I have uploaded some to the files section. I apologize for the quality but need to keep files small for uploading.

This will give some you an idea how the unit sounds when listening to WWV or shortwave stations.

I was using my vertical for all recordings this week.

Fred,
Thanks for sharing, but I could not open the .3GP file on my XP machine.
MS offered download sites and I chose RealPlayer. RealPlayer then said I needed QuickTime, which I also downloaded.
But it's still a no-go.
Anyone have any better ideas?
Thanks in advance, Ray

Ray,It works here on XP,Vista ,and WIN 7. Also you may need the latest flash player. Go to filehippo.com. That site have every download you need and also I remember I downloaded one then I had to double click the ICON and it started to install. Make sure you check any boxes saying you agree. It played here but no audio. Check that site. Bob AF2Q

Fred,
Thanks for sharing, but I could not open the .3GP file on my XP machine.
MS offered download sites and I chose RealPlayer. RealPlayer then said I needed QuickTime, which I also downloaded.
But it's still a no-go.
Anyone have any better ideas?
Thanks in advance, Ray

Attachments: 1 described; binary payloads are missing from this source WARC

Ok just worked SP7HOV on 18080.200 and he gave me a 559..

He was also a 559 with very heaving fading.

This was at 0005 May 13th 2013(z)..

Not bad huh?

Using a vertical antenna..

SP7HOV <http://www.qrz.com/atlas?dxcc=269> Poland flagPoland
<http://www.qrz.com/atlas?dxcc=269>
Zbigniew Oltarzewski, SP7HOV
Mlynarska 56

Ok it is 0232z, May 13th 2013z and 17 meters is full of cw signals, VE3FAL hears TM35HOP calling CQ and working stations all over North America.

VE3FAL is running the X1M into a vertical antenna on up 10' off the ground on a tin roofed canopy.

He calls TM35HOP in France and gets a call back, he gives me a 599 (but I know better0, but he was a good 579 to a 599.

I was on 18076.2 when I worked him..

Not bad huh, or is it eh?!!!!

Cheers

No I never, I don't usually use phone and have put this radio through the cw test for sure.

I am a cw guy and really don't play much on phone..

I should give it a whirl this week and call CQ on 20 meters or 17 and see what happens.

That is a remarkable achievement not OT by any means. All of my contacts have been qrp and using wire antennas or the most part since I started radio.

I have never kept track of how many countries or grids or counties etc that I have worked.

Only up till this past year all my logs have been paper, but since I find myself entering more qso parties I use a logging program to help keep count, check for dupes etc.

That is the name of the game Bob, to operate, so that was a great endeavor on your part..

Cheers

All this chatter about QRP is making me wanting to really try it. It would make me pay close attention to the other elements instead of just hoping watts will make up for sloppy tuning, etc.

MON 13 MAY 2013
To all awaiting delivery of their X1Ms,
I just took delivery of my X1M this morning.
Cannot reference by it's serial number because ...
there isn't one ... just "S/N:"
The SO239 RF socket (with non-standard threads ?)
has been replaced on mine with a BNC(F) RF Connector.

204. Arrived !

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-13 20:53:16 UTC
From: auto_prof1
Topic: 204 Message: 204

Received my X1M transceiver today in the mail today, connected my 40 meter End-Fedz antenna which I haphazardly strung around the family room, great room and wherever there was a perch. Connected my power supply, (A stealthcam 7 Amp Hour battery) to it....and voila !!!! Noise and QSO's heard. The size is something else. I can't wait to take it out to a remote site, or even my backyard and make some contacts. Mine indeed has a BNC connector on the rear instead of a SO-239....but it's a very neat package and very compact.

Thank you Ed for keeping me (us) informed of the status of our orders.

Chip - K9MIT

62 Year Old retired guy, having fun again.

That is great news, that will ease any frustration with all the multiple PL259's that are out there.

Subject: [X1M_QRP-Transceiver] Re: X1M will have BNC connector

MON 13 MAY 2013
To all awaiting delivery of their X1Ms,
I just took delivery of my X1M this morning.
Cannot reference by it's serial number because ...
there isn't one ... just "S/N:"
The SO239 RF socket (with non-standard threads ?)
has been replaced on mine with a BNC(F) RF Connector.

Got my X1M and tried it out on my Air Force 4 MHZ frequency. Was able to check in without any problem. Seems to be performing well. Looking forward to the computer adapter to use HR Deluxe which will make tuning a little easier.

Glad the units are arriving and looking forward to seeing more reports. I tried calling cq on 14.140 today to see if I could work someone on voice but no luck. Was going to try and check into the Maritime Mobile Net but also had no time tonight.

208. No Transmit on SSB

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-14 01:59:09 UTC
From: kg0ew
Topic: 208 Message: 208

Hi everyone,
Just unpacked my X1M. Seems to work on CW, though the sidetone is gawd-awful loud and very harsh - no sinewave here! No such luck on SSB however, with the provided mic, the PTT doesn't work - radio stays in receive.

I'm guessing a bad PTT switch in the microphone is the most likely culprit, Before I start tinkering, has anyone else seen this problem?

Thanks & 72,
KG0EW

Yes the sidetone is very loud and an adjustable sidetone was one of my recommendations that I made in reviews of this radio.

Make sure the microphone is pushed in all the way, and try using the microphone after unplugging the cw key.

At first I thought you could not run either if both plugged in but was not the case.

It will transmit anywhere between 1 and 29.999 megs on either cw or ssb.

Test the microphone with a multimeter and ensure the microphone is working.

PTT for the microphone if using a multimeter will show zero when keyed and measured across the ground and center.

Ok just worked KF5JUG in El Paso Texas on 14.300 on the net, he was running a tribander and 600 watts.

He gave me a 5x2/5x3 and said the audio sounds compressed, not overdriven but like I was talking into a tin can.

So that is a good contact and test on phone with this little unit.

I was on my hustler 80-10 vertical antenna and nice to get this report.

So compressed is the first actual report I have gotten so far. Be glad to hear other audio reports.

Fred,
Shouldn't that be across ring and sleeve? If it really is tip and sleeve, than you've identified the problem, and the mic is wired incorrectly.

I would imagine using something like a cheap digital recorder, or old tape recorder microphone, or a computer headset mike that doesnt require power for the condenser (unless the x1m has plus V on the mike plug) would provide somewhat better audio than the poorly designed hand mike. The microphone element in the hand mike is probably ok, but the plastic and small acoustic chamber is likely what is contributing to the tinny crusty sound.
Guess these little guys haven't been out long enough for anyone to start playing with higher quality microphones etc yet.
is there an onboard processor or audio boost or anything like that other than basic mike gain?

I found that when I first plugged in the mic that when I push to talk all I got was a clatter. Thought that the mic had been pushed in all the way but it wasn't. I pulled out the plug and reseated it and the clatter went away. The tolerance of the plug and receptacle on the radio must be very close, and any misalignment will prevent the PTT from working properly.

The microphone element in the hand mike is probably ok, but the plastic and small acoustic chamber is likely what is contributing to the tinny crusty sound.
> Guess these little guys haven't been out long enough for anyone to start playing with higher quality microphones etc yet.

Your statement caught me on surprise..you had checked into the AIRFORCE NET....
Very good...
How far does the radio transmit on 80 meters...say to 4050?
Also on 40 meters?..say to 7350?..if you have tried in that area<mars>.

It looks like a Marine HF SSB rig.

The anti-collision alarm sounds like an input from a MArine RAdar set.

Here's a tiny bit more information on this thing:

http://www.cqdx.ru/ham/new-equipment/ftgmdc-feitong-chinese-ft-808-hf-transceiver/

Not that we're much wiser than before, but a little. I wonder if there's an auto tuner available for it (doubt it); is it computer controllable/programmable (no clue); why does it say HF/VHF when it only lists HF bands (no matter, $400 is a pretty killer price for what sounds like a 100-watt rig, unless it's total crap).

It's a marine rig, probably preloaded with the Marine channels. Note that it does not have a tuning knob. entering Ham radio frequencies may be cumbersome.

and, if it's anything at all like most marine HF radios, it's pretty simple to change it to tx continuous and get the HF ham bands out of it.

ah, should have read the page at the link you sent.
Looks interesting.
Sometimes these rigs are great to operate mobile or in the field because they are fairly stripped down and don't have allot of the bells and whistles modern ham rigs tend to have that distract from operating sometimes.
It says HF VHF, so are they considering 10M to be VHF? the freq range states up to 29.9999MHZ and no higher.
Looks like a 100W rig, perhaps more because the max current draw is 25 amps which would indicate around 120W of output.
And I don't think the marine VHF frequencies would be preprogrammed as there are more than 100 of those lol.

Tnx FRED for the answer on xmiting..sounds good...now to see reports on digital<I am cautious on what I buy, it is close to fitting the bill>,
One wouldnt need a tnc..just like I do connect from the digital plug into computer headest in/out, works fine, have done it for years on my YAESU...
Now for reports on digital.

Hey Fred,

By "keypad", do you mean a numeric keypad, or, like, just buttons for up/down/etc.?

I'd sure like to see one of these. Might be worth writing to Grace what's her name and asking about computer control and other things.

244. Poor First Impression

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-14 22:17:56 UTC
From: ewmicro
Topic: 244 Message: 244

I received my X1M this afternoon. I briefly gave it a shot on CW. The first thing I noticed was that the key was reverse wired (i.e. for a lefty).

Mine only puts out 2 to 3 watts CW into a dummy load. Is anyone getting 5 watts out?

One of the buttons was sticky.

As mentioned in a previous post, the sidetone is very raspy and loud enough to scare you. Also, as previously mentioned, the max audio is not very loud. My speaker rattles - sounds like it is hitting the case.

My LDG Z11 Pro has trouble matching my antenna. I have no problem with the Z11 matching my Elecraft KX3 on the same frequency & antenna.

I haven't investigated any of this. I only had about 5 minutes to play with it. I emailed Ed and asked whether opening the case would invalidate the warranty - whatever that is.

This leaves me with a rather poor first impression.

I thank the buyers for their honesty. I have had my finger on the "submit" button for days, but now I will wait until the market settles down. There must be a lot of pressure to supply finished radios to the waiting list. Looks to me like my chance of getting a good unit is around 50%. But it is so cute, small, and so many features. :-))

George,

It is my expectation that more low price multi-band HF
rigs will be hitting the market later this year and early 2014.

The X1M has broken open the market and will have lots
of company in various forms soon.

I'm aware of one such project planned for Dayton 2014
that is LF to 10.5 GHZ multimode in kit form as a milliwatt
exciter for $200. with 5, 20, & 100w amp module options.

There are already other kits and projects out there
with more to come for sure!

Jim,
Sorry you are having some issues with your X1M. Mine is working great on SSB. Just wonder what band you are getting 2-3 watts out on. I notice that mine has reduced output on 15 and 10. Mine puts out 4-5 on 80, 40 and 20.

I have had one for over 3 weeks now and love it. Working a lot of DX on 15
and 20 meters with a ground mounted 5BTV. Got mine from
www.importcommunications.com in N. Carolina for $299.

I get about 3 watts on 80 meters, decreasing to about 1.5 watts on 10 meters. I am going to open it up and look for anything obvious.

I have full power on mine across the band, 4.5 watts is the baseline power out with the odd area peaking 5 watts..This is into a dummy load.

Mine only puts out 2 to 3 watts CW into a dummy load. Is anyone getting 5 watts out?

One of the buttons was sticky.

As mentioned in a previous post, the sidetone is very raspy and loud enough to scare you. Also, as previously mentioned, the max audio is not very loud. My speaker rattles - sounds like it is hitting the case.

My LDG Z11 Pro has trouble matching my antenna. I have no problem with the Z11 matching my Elecraft KX3 on the same frequency & antenna.

I haven't investigated any of this. I only had about 5 minutes to play with it. I emailed Ed and asked whether opening the case would invalidate the warranty - whatever that is.

This leaves me with a rather poor first impression.

252. Just purchased two and did a quick run thru, found some minor issues

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-15 14:04:48 UTC
From: George C
Topic: 252 Message: 252

Just got two from Ed Griffin. Fast service, BTW. As another reported it appeared a problem with a radio or mic. Key radio, and it would continuously over current the p/s and reset, do again, etc. That particular radio also had very loose front and back panel screws. So took apart, re-assembled problem seemed to go away but returned a while later and then it didn't key at all. Looked at the plug. The flat part of the mic connector has to be right up against the mic jack or it does all of the above. But if you screw the plastic shell as far as it will go on the plug it will keep the mic connector out enough for funny stuff. So I echo what someone else said, just back the shell off a bit and it is fine.

RX sensitivity on some bands was not great. This is the output filters not being the greatest (hey, $299, right?)and that's not the biggest point here, but the frequency they have in the code running the rig where filters change is the problem. 7.150? Really? Sensitivity much better at 7.14999 than at 7.150. That transition should be moved to 7.0, for example. Now the reduced sensitivity is never going to be a true operational problem, but is an annoyance. If they other guy isn't strong he isn't going to hear you anyhow with the X1M.

Power output was about 5 watts, current draw for that was somewhere around 1.5 amps. RX current seems higher than I expected, looks like a half amp.

The LSB carrier point is way, way out of whack. The carrier is well inside the filter passband, making everything sound bad. No high frequencies in recovered audio. Now it is settable in the setups, but looks like it will take some fiddling to find the right frequency for it. (again, $299...it's ok)

One of the pair had a very real problem. Spurs, very wide band crap from the PA. Key up, current draw up to 1.5 amps, no speech, 5W out. The spectrum analyzer used was on my IFR 1100 and it was as wide as its sweep would go. But other times it was clean(er) with spurs about 20 db down every mhz or so. Eh? That part could be better.

It also will go into transmit anywhere it receives. The reason I bought it was because I figured at some point these will either be banned or the manufacturer will need to inhibit transmit outside of ham bands.

Bottom line, pretty slick. When I'm back home in about 10 days I'll put it on some more critical test gear and get better measurements, especially of the wide noise, but last night didn't feel like firing up the real spectrum analyzer/service monitor. I can see the backpack/manpack folks getting excited over this one.

I can see these being the talk of Dayton.

I'd REALLY love to get hold of a schematic.

Great job George and nice to see other comments from folks.

Yes for the price you can't go wrong.

I agree on the PBF, you step outside and man the band comes to life.

Keep us up to date on all of your findings.

@Mark kv8t. Are you talking about the Ft-808 HF rig or the X1M ? This particular thread is talking about the FT-808
That is why we are saying we need to get a FT-808 here in the USA, there are already X1M's here in the USA and Hams already have them in their hands. The FT-808 has yet to come here.

255. X1M first Impressions continued.....

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-15 15:19:39 UTC
From: Fred VE3FAL
Topic: 252 Message: 255

It is a very exciting rig for sure.. I like to see all the comments about these radios as does Ed, does not matter good or bad, as that is the only way to perfect something.

Some of the notes I have seen are:

1) Power output

2) Cw sidetone

3) Speaker volume

4) Questions about transmit area(filters)

5) Digital operations

When I tested this unit before it started to ship I found power output to be very stable across the entire spectrum. A solid 4.5 watts.

Sidetone volume does need to be adjustable either with a hole in the case or from the menu

Speaker volume I found to be good, never noticed much in the way of raspy signals or lack of volume

This radio will transmit across the entire spectrum on cw or phone, there are no gaps, but remember the pass band filters are designed for the traditional ham bands..

Awaiting a cable for this radio as well to test on psk and see what it will do.It would be great to be able to use it and my NuePSK in the field, be very portable.

If you take the radio apart for whatever apparent reason, please make note:

DO NOT REMOVE THE SCREW ON THE BOTTOM COVER, YOU WILL HAVE A HECK OF A TIME GETTING THINGS BACK.

Regards

Fred

But if you screw the plastic shell as far as it will go on the plug it will keep the mic connector out enough for funny stuff. So I echo what someone else said, just back the shell off a bit and it is fine.

RX sensitivity on some bands was not great. This is the output filters not being the greatest (hey, $299, right?)and that's not the biggest point here, but the frequency they have in the code running the rig where filters change is the problem. 7.150? Really? Sensitivity much better at 7.14999 than at 7.150. That transition should be moved to 7.0, for example. Now the reduced sensitivity is never going to be a true operational problem, but is an annoyance. If they other guy isn't strong he isn't going to hear you anyhow with the X1M.

Power output was about 5 watts, current draw for that was somewhere around 1.5 amps. RX current seems higher than I expected, looks like a half amp.

The LSB carrier point is way, way out of whack. The carrier is well inside the filter passband, making everything sound bad. No high frequencies in recovered audio. Now it is settable in the setups, but looks like it will take some fiddling to find the right frequency for it. (again, $299...it's ok)

One of the pair had a very real problem. Spurs, very wide band crap from the PA. Key up, current draw up to 1.5 amps, no speech, 5W out. The spectrum analyzer used was on my IFR 1100 and it was as wide as its sweep would go. But other times it was clean(er) with spurs about 20 db down every mhz or so. Eh? That part could be better.

It also will go into transmit anywhere it receives. The reason I bought it was because I figured at some point these will either be banned or the manufacturer will need to inhibit transmit outside of ham bands.

Bottom line, pretty slick. When I'm back home in about 10 days I'll put it on some more critical test gear and get better measurements, especially of the wide noise, but last night didn't feel like firing up the real spectrum analyzer/service monitor. I can see the backpack/manpack folks getting excited over this one.

I can see these being the talk of Dayton.

I'd REALLY love to get hold of a schematic.

Jim,
I am also getting about 1.5 watts on 10. Be carefull with the large screw on the bottom, it is holding in the PA transistor. Let me know what you come up with.

Subject: [X1M_QRP-Transceiver] X1M first Impressions continued.....

It is a very exciting rig for sure.. I like to see all the comments about these radios as does Ed, does not matter good or bad, as that is the only way to perfect something.

Some of the notes I have seen are:
1) Power output
2) Cw sidetone
3) Speaker volume
4) Questions about transmit area(filters)
5) Digital operations

When I tested this unit before it started to ship I found power output to be very stable across the entire spectrum. A solid 4.5 watts.
Sidetone volume does need to be adjustable either with a hole in the case or from the menu
Speaker volume I found to be good, never noticed much in the way of raspy signals or lack of volume
This radio will transmit across the entire spectrum on cw or phone, there are no gaps, but remember the pass band filters are designed for the traditional ham bands..
Awaiting a cable for this radio as well to test on psk and see what it will do…It would be great to be able to use it and my NuePSK in the field, be very portable.

If you take the radio apart for whatever apparent reason, please make note:

DO NOT REMOVE THE SCREW ON THE BOTTOM COVER, YOU WILL HAVE A HECK OF A TIME GETTING THINGS BACK.

Regards
Fred

To: X1M_QRP-Transceiver@yahoogroups.com
Subject: [X1M_QRP-Transceiver] Just purchased two and did a quick run thru, found some minor issues

Just got two from Ed Griffin. Fast service, BTW. As another reported it appeared a problem with a radio or mic. Key radio, and it would continuously over current the p/s and reset, do again, etc. That particular radio also had very loose front and back panel screws. So took apart, re-assembled problem seemed to go away but returned a while later and then it didn't key at all. Looked at the plug. The flat part of the mic connector has to be right up against the mic jack or it does all of the above. But if you screw the plastic shell as far as it will go on the plug it will keep the mic connector out enough for funny stuff. So I echo what someone else said, just back the shell off a bit and it is fine.

RX sensitivity on some bands was not great. This is the output filters not being the greatest (hey, $299, right?)and that's not the biggest point here, but the frequency they have in the code running the rig where filters change is the problem. 7.150? Really? Sensitivity much better at 7.14999 than at 7.150. That transition should be moved to 7.0, for example. Now the reduced sensitivity is never going to be a true operational problem, but is an annoyance. If they other guy isn't strong he isn't going to hear you anyhow with the X1M.

Power output was about 5 watts, current draw for that was somewhere around 1.5 amps. RX current seems higher than I expected, looks like a half amp.

The LSB carrier point is way, way out of whack. The carrier is well inside the filter passband, making everything sound bad. No high frequencies in recovered audio. Now it is settable in the setups, but looks like it will take some fiddling to find the right frequency for it. (again, $299...it's ok)

One of the pair had a very real problem. Spurs, very wide band crap from the PA. Key up, current draw up to 1.5 amps, no speech, 5W out. The spectrum analyzer used was on my IFR 1100 and it was as wide as its sweep would go. But other times it was clean(er) with spurs about 20 db down every mhz or so. Eh? That part could be better.

It also will go into transmit anywhere it receives. The reason I bought it was because I figured at some point these will either be banned or the manufacturer will need to inhibit transmit outside of ham bands.

Bottom line, pretty slick. When I'm back home in about 10 days I'll put it on some more critical test gear and get better measurements, especially of the wide noise, but last night didn't feel like firing up the real spectrum analyzer/service monitor. I can see the backpack/manpack folks getting excited over this one.

I can see these being the talk of Dayton.

I'd REALLY love to get hold of a schematic.

Yes all the pages say $400 - $500 but contact them and try to order one and you will find out the real price. I am in China doing buying now. I've seen this radio before and was excited at the price but soon became un excited when I got the real price. If the price was $400 range, I would have purchased many and they would be on my site now. Best not to believe what you read on the Chinese wholesale sites, most have wrong selling prices. I deal with this everyday here

I received my X1M the other day from ImportCommunications. Out of the box, I had a problem. The preamp circuit did not work. After testing the radio out over the course of a day and a half, the preamp started working. I could hear a relay click as the preamp was engaged/disengaged. Today, as I was using the radio, the preamp cut out while I was listening to a friend transmit. I am again unable to engage the preamp. Seems as though the button or relay is intermittent.

The RIT function also acts strangely at times. When tuning with the RIT, the frequency will jump wildly. As I am turning the VFO dial to adjust RIT, it will suddenly jump several hundred hertz.

The receive audio output is very low. The preamp (if working) would have to be engaged all the time so I can hear the stations. Without the preamp, I have to have the volume turned fully up, and even that is not enough.

I tried the radio with an amplifier, and it did not provide very much drive. I could only get about 30-50 watts PEP out of an amplifier, using the stock microphone. I wired up an old CB radio powered hand mic, and that yielded better results, seeing 50-70 watts PEP. In both cases however, I had to be right up on the mic in order to get sufficient drive. The TX audio circuit is low, and really needs to be brought up, if you want to be heard well.

Reports from receiving stations indicate good clean audio. A friend sent me cell phone video of my signal, and it did sound good. Both the stock mic and the powered mic yielded good audio, but the lack of audio is an issue.

I had contacted Ed at ImportCommunications as soon as I realized there was a problem with the preamp, and he will resolve the issue when he gets more in stock. In the meantime, I will continue to do testing. I would like to hear if anyone else is having these problems.

Back in August 2012 when I first tested this radio I has problems with the buttons as well and that was one area that was being looked into to make better.

In fact in one of the youtube videos out there when showing the X1M the person in the video also had problems with the button.

You are right, with the preamp off the radio can tend to be very quiet, but I know locally at night on 80 meters I hear the locals just fine with the preamp off.

I also noted the same issue with the RIT, however that same issue is not present in regular tuning of the radio.

I was on 14.300 the Maritime Mobile net and was told my audio was not over driven at all but was sounding like I was talking into a tin can.

Hi Jim & all,

My arrived with a rattling speaker as well. It would sort of clunk when turned over one direction. At the directions of Ed I took it apart and found the speaker was no longer glued to the board and a solder joint was broken to the casing of the speaker. However, the speaker does work (as there are two connections below the board).

Also if you are going to take it apart the way I succeeded in doing it was removing the 4 screws on the back plate, the top 2 screws on the front plate. Then I gently pulled the back plate away from the body -- be careful the coax going to the BNC connect is VERY stiff and seems like it would be easy to pull off the BNC connector or the board end. Move the back plate away and down and the entire top SLIDES ouf the back. The bottom and top plate slide onto/into each other and the front and the back plate hold them in. As Fred has warned -- Don't take out the bottom silver screw!

My tuning know was also slightly bent -- although this doesn't appear to affect the function just mildly annoying. Still putting the rest of it through its paces.

Well I was going to order one a couple of weeks ago. Glad I didn't. These folks in China better but in some overtime and get it right. It is sounding like the early HB-1A days all over again. So I guess I'll wait till all of the complaints are fixed.

Hi Jim & all,

My arrived with a rattling speaker as well. It would sort of clunk when turned over one direction. At the directions of Ed I took it apart and found the speaker was no longer glued to the board and a solder joint was broken to the casing of the speaker. However, the speaker does work (as there are two connections below the board).

Also if you are going to take it apart the way I succeeded in doing it was removing the 4 screws on the back plate, the top 2 screws on the front plate. Then I gently pulled the back plate away from the body -- be careful the coax going to the BNC connect is VERY stiff and seems like it would be easy to pull off the BNC connector or the board end. Move the back plate away and down and the entire top SLIDES ouf the back. The bottom and top plate slide onto/into each other and the front and the back plate hold them in. As Fred has warned -- Don't take out the bottom silver screw!

My tuning know was also slightly bent -- although this doesn't appear to affect the function just mildly annoying. Still putting the rest of it through its paces.

Unbeleivable about all the complaints. I've had mine over 3 weeks now and aside from a little lower output on 10 meters mine works great. Working many DX stations in europe with good reports.

Thanks Fred. I tried the rig again this morning. It looks like it is intermittent. Here's what I got into a dummy load at the low end of each band when it was working ok. I don't know why the powere went back up on 10 meters, but these results are acceptable to me.

80 5w
40 4w
30 5w
20 3.5w
15 3w
10 4.8w

This was with a 60w dummy load I bought on ebay and a Diamond SX-200 SWR/Power meter on the 5 watt scale.

I had intermittent endless tuning loops on my LDG Z-11 Pro tuner when connected to my Zepp end fed antenna. Something funny is going on impedance wise. I haven't opened it up yet. I want to baseline it first.

I tried SSB. At first, I had no PTT. The mic plug was intermittent at the radio.

Since I haven't been able to load up my antenna, I cojuld not try to make QSOs yet..

Ok Jim, well lets hope we get this sorted out.. There will be some bad radios in each lot, I can almost guarantee that. I have seen it before.

These are well built in my eyes, and it might be small things like buttons and glue..

Other problems will stem from shipping, quality control and poor soldering in the factory.

But you have to look at the horsepower under that little hood.

There is a whole lot of gear in that package, so to have a few go bad is normal.

Now I know Ed will do his best to keep you guys running and happy, that is why he is there.

I know things will work out, like I said before and if you never read my first review from Augsut 2012, please do so, there have been many many good changes.

Fred

It is a very exciting rig for sure.. I like to see all the comments about these radios as does Ed, does not matter good or bad, as that is the only way to perfect something.

Some of the notes I have seen are:

1) Power output

2) Cw sidetone

3) Speaker volume

4) Questions about transmit area(filters)

5) Digital operations

When I tested this unit before it started to ship I found power output to be very stable across the entire spectrum. A solid 4.5 watts.

Sidetone volume does need to be adjustable either with a hole in the case or from the menu

Speaker volume I found to be good, never noticed much in the way of raspy signals or lack of volume

This radio will transmit across the entire spectrum on cw or phone, there are no gaps, but remember the pass band filters are designed for the traditional ham bands..

Awaiting a cable for this radio as well to test on psk and see what it will do.It would be great to be able to use it and my NuePSK in the field, be very portable.

If you take the radio apart for whatever apparent reason, please make note:

DO NOT REMOVE THE SCREW ON THE BOTTOM COVER, YOU WILL HAVE A HECK OF A TIME GETTING THINGS BACK.

Regards

Fred

Hey Fred,

By "keypad", do you mean a numeric keypad, or, like, just buttons for up/down/etc.?

I'd sure like to see one of these. Might be worth writing to Grace what's her name and asking about computer control and other things.

I see a good sideline for someone who has the talent and time to tweak these little gems to specs, for, let's say, $50.

Fred, I knew I could be for trouble with a Chinese rig. I am not worried. I was initially upset after playing with the rig in the first five minutes. I know it will all work out in the end. I also have a bunch of Chinese HTs. I was spoiled by Yimin with my HB1A, HB1B and antenna analyzer.

No problem Jim, don't worry Yimin and I have had our share of issues as well with that line..

You should see some of the stuff we have had shipped back that was destroyed because of inadequate packaging.

YouKits had the same problem at first to with the HB1A and no good packaging, bent knobs etc, but in the end it all works out after some trial and error.

The TJ2B is selling well and getting both good and bad comments from some builders, but it has come a long way since the TJ2A, man that was a tough build.

Again the biggest complaint usually is shipping costs and returns or parts exchange.

Take care Jim and will yak later.

Fred

Other problems will stem from shipping, quality control and poor soldering in the factory.

But you have to look at the horsepower under that little hood.

There is a whole lot of gear in that package, so to have a few go bad is normal.

Now I know Ed will do his best to keep you guys running and happy, that is why he is there.

I know things will work out, like I said before and if you never read my first review from Augsut 2012, please do so, there have been many many good changes.

Thanks Fred. I tried the rig again this morning. It looks like it is intermittent. Here's what I got into a dummy load at the low end of each band when it was working ok. I don't know why the powere went back up on 10 meters, but these results are acceptable to me.

80 5w

40 4w

30 5w

20 3.5w

15 3w

10 4.8w

This was with a 60w dummy load I bought on ebay and a Diamond SX-200 SWR/Power meter on the 5 watt scale.

I had intermittent endless tuning loops on my LDG Z-11 Pro tuner when connected to my Zepp end fed antenna. Something funny is going on impedance wise. I haven't opened it up yet. I want to baseline it first.

I tried SSB. At first, I had no PTT. The mic plug was intermittent at the radio.

Since I haven't been able to load up my antenna, I cojuld not try to make QSOs yet..

Mine only puts out 2 to 3 watts CW into a dummy load. Is anyone getting 5 watts out?

One of the buttons was sticky.

As mentioned in a previous post, the sidetone is very raspy and loud enough to scare you. Also, as previously mentioned, the max audio is not very loud. My speaker rattles - sounds like it is hitting the case.

My LDG Z11 Pro has trouble matching my antenna. I have no problem with the Z11 matching my Elecraft KX3 on the same frequency & antenna.

I haven't investigated any of this. I only had about 5 minutes to play with it. I emailed Ed and asked whether opening the case would invalidate the warranty - whatever that is.

This leaves me with a rather poor first impression.

273. Portable today

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-16 03:26:52 UTC
From: w2ndg_neil
Topic: 273 Message: 273

I took the radio up to West Hills Park here on Long Island today. West Hills is next to Jaynes Hill, which is the highest point on Long Island (a real nosebleeder at 400 feet!). I threw a 40' wire up in a tree near the car, attached it to an Emtech ZM2 tuner, and used the car for power.

I tuned around for a long time, just getting the feel for the bands today and the strange conditions. I made 2 good contacts, both on 15M USB. One with Columbia, and the other with Venezuela. Not bad.

Reports have been good since the beginning, with no comments about tin cans or otherwise.

I have had a couple of issues though:

-The connector on my mic came apart. I was able to solder it back together, but I needed to take the mic apart to trace the wires to their origins to get an idea as to what to put where. The mic has a speaker in it, but is not connected. This is basically one of those Baofeng speaker-mics they sell on eBay, with a custom-wired connector on the end.

-If I use the radio A LOT, I get a weak audio issue, but it might be a receive issue since the sidetone and power-up tones are still at normal volume. I was told that I can swap it for a later one once more are available. It did not happen today.

All in all I am very pleased. I am looking forward to some more outdoor work with it.

73 all!

Neil - W2NDG

Is the X1M now type accepted by the FCC ? If no, can it legally be sold commercially into the USA market without type acceptance? I thought ham gear in quantity required type A unless in kit form. ??

(Ignoring the fact that these are already being sold by a few distributors). ?

Theree *is* no type acceptance for amateur gear, except for linear amplifiers that operate between 25 and 50 MHz. Of course, I *think* there might be a requirement for part 15 certification, but I'm not sure of that. At any rate, there's no specific type acceptance for amateur gear.

To follow up what Buddy said:

FCC radio approval in the United States

In the United States, all commercially produced radios need some sort of FCC approval to be sold and used in the USA. Depending on the type, frequencies used, and other technical specifications, different processes are used. Typically, any radio that operates below 30 Mhz are exempt from the provisions covered on this page.

The current influx of Chinese manufactured radios has created a great deal of confusion. To keep it simple... If the radios do NOT have an FCC ID, then they ARE NOT LEGAL in the USA.... period.

Read on... This page tells you why....

Types of FCC approval:
Type Approval:
This process assures equipment complies with technical specifications, such as interference issues.

Type Acceptance:
This process assures equipment meets specifications of specific radio services. Once type accepted, a radio can be legally used on that specific service. Some radios are type-accepted across multiple services. All radio services with the exception of the Amateur radio service require type-accepted equipment.

Theree *is* no type acceptance for amateur gear, except for linear amplifiers that operate between 25 and 50 MHz. Of course, I *think* there might be a requirement for part 15 certification, but I'm not sure of that. At any rate, there's no specific type acceptance for amateur gear.

No way this thing is part 90 accepted (that's for commercial radios and likely a reference to the Wouxun products, not the X1M)...

K7JOE your probably right , as it refers to gear 50 megs and up, so that is probably a generic statement to cover those units.

The TS button on mine is flakey. Tries to change tuning steps but oscillates between Mhz and 100Khz position only. It also changes the mode, hints at there being a short to adjacent button. Will put under microscope when I get back from Dayton.

With a watt meter in series I noticed high signal level when on out of band and not talking. Something was causing high carrier signal with out talking into mic, only when out of band.

292. Some testing results

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-18 17:19:33 UTC
From: George C
Topic: 292 Message: 292

Wish I had more time to do some more, not being helped by the fact that my service monitor's printer cart has dried up ink, and the cartridges are getting REAL rare. An old HP. So I cannot print and scan but have to use my shoe-phone to take pix and that's cumbersome.

I have uploaded a file (or will right after I finish this) called X1M_SPEC_AN.pdf to my web site. http://dyb.com/X1M/X1M_SPEC_AN.pdf

The pictures are of one unit on 75-10, but a second rig was checked on 40. On all bands with preamp on receive was"ok". Not the same as my FT-1000D. They "hear" 0.1 uV barely at the noise level. I didn't do 20db S+N/N check, but by ear that seems to be about 1 uV. Now if this were a FT1000 or one of my Micom-2's I'd be bothered. But all things considered, not too bad. RX filter seems good. I need to measure it. LSB filter position relative to carrier is way, way off, so in LSB mode both units were not going to make good audio, and reception is bad. As I have posted earlier, there is a setting for the carrier frequency in all modes, and when the LSB carrier is placed at the "right place" the indicated operating frequency is WAY off...but just in LSB. This looks like a firmware problem, but what do I know? USB is perfect. CW is ok, yeah, sidetone needs an adjustment of some sort. L/M/H in settings, or something like that.

Power out on both units was down about 3db for the most part. Don't go by the spectrum analyzer dbm numbers in my pix, those were with voice and were varying a db or so with voice.

I had one instance of RF feedback, may have been a bad ground from the power supply.

But looking at the pictures...40 was clean except for a spur down 50db at about 3.6 mhz (Hmmmm Fo/2 ??). Both rigs. 75 had spurs at about 1.25 mhz intervals up and down that seem down about 35 db. (Fo/3 ??)This is sub milliwatt, and does not bother me. 20 had some sizeable spurs. Though the worst one was down about 40db. so still not too worried about it. Worst case on 15 was down 46db, and on 10 also not the cleanest it was 35db down worst case.

So as the rig stands, it can use some help with these spurs. Operating barefoot, even though RF output is not as specified it is what it is. I would NOT put this into an amplifier, which can make the spurious situation worse.

Then there is the mic and key jack mechanical issue. push the connector in so the metal flange on the plug is up against the jack. If not it looks like something can short something and it takes my current limited supply down for a moment.

I still think it is pretty slick. Especially the go-anywhere part. Now my personal opinion is that at $299 it is a bit high, considering these deficiencies. $199 would have been better. If it were clean and not had the LSB issue the $299 is ok. And THAT is no fault of the importer, so I know of people that want to "Give Ed a piece of their mind" at Dayton. Hold off, guys. Ed didn't build it.

And as usual I see the customary flame wars brewing over type acceptance/type approval, part 90 (which really has no HF stuff except very, very limited circumstances. HF is mainly marine and Aviation. part 22 and 87. But it ain't an issue, and I know people like to display their knowledge or lack of for the FCC rules, but guys, it's a 2 watt HF radio. Not worth the heartburn to argue over.

So I hope the manufacturer has some fixes for some of these issues. The DB-9 on the back suggests that maybe, just maybe they can insert new firmware by serial connection. That could fix lots of it.

And speaking of the DB-9, anybody have the pin out for making a cable to talk to HRD, since it is supposed to "look like" a IC-718? I wanted to fiddle with that. Just looking at these pins with a scope didn't give any real hints.

I use mine really for monitoring things like 6604, 10051, 13270, 11175, etc. That all works fine, wish it had Motorola SSB squelch.

Fred, can you upload that info to the group? I'd like to know what the pots are for. Also, any known existing schematic, or a pinout of the DB-9 connector? That info would be VERY handy to have.

I run a couple of Allstar nodes, and one of the HF remotes it does support is IC-706, which I believe is very much like IC-718 so this could be part of a real slick remotely operated HF radio. But just with scope and RS232 tools it didn't seem to be a conventional RS232 connection, plus the manual says something about this port also controlling a tuner. At least I think that's what is meant by AAT....

I've scoured the internet and even Xiegu's (translated) web site for a ny info and it is nil.

Still a slick rig.

I have to re-check my power out, I made all measurements at about 13V. Going to try 14 or 14.5, maybe that will be better.

Thought was if not able to turn down from menu to put hole in cover to allow an adjustment. My TenTec Scout has just that for power and sidetone volume.

301. maybe a serious PA issue

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-19 15:54:27 UTC
From: George C
Topic: 301 Message: 301

Look at http://dyb.com/X1M/X1M-02-WIDEBAND_NOISE.jpg

This is what I saw the other night and it did it again yesterday. This shows 2.185 mhz to 52.185 mhz, center being 27.185 (yeah, yeah, I know...but it did it in the ham bands as well)

Now it wasn't a bad termination, I know that, this was thru some very good RG142 cables into a 50 ohm termination. The first time I saw this was on 75 and into an antenna thru a Z100 tuner. Also, if I placed my hand on the cabinet it would stop. Starting to think some added bypassing on the DC in might be the answer.

302. CW Key Wiring Help/Question

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-19 15:54:53 UTC
From: ballardian36
Topic: 302 Message: 302

Can anybody enlighten me on a key should be wired to the stereo jack?

A buddy and I were able to get a straight key working using connections to the sleeve and the ring of the plug but we never seemed to get the tip to work. We wired up a paddle and 1/2 of the paddle that was connected to the ring would work but the one wired to the tip never did. We also couldn't seem to get the built in keyer to work. Any connection we made would just be a solid tone like a straight key.

If anyone could enlighten to me on how this all 'seems' to work I'd much appreciate it. I want it to be that I just wired the stuff wrong but I'm suspicious that something else is amiss in the radio.

Thanks,
-Chris

I feel so silly for not reading down to the last message before writing that :-)

Maybe I get a cable and dissect it.

I'm sure he had a busy weekend. I had one friend who wanted to go complain about the cheesy construction. I had to keep reminding him that it was only $299, or whatever it was. I guess some people still believe in a $0.10 cup of coffee too...

OK, thanks for the info.

No problem George that is why this group is here..Gotta remember Ed does not make them, he just brings them in.

Folks can always spend the big bucks on Tentecs or Elecraft if they get that picky.

For portable use and for the bang for the buck, it is pretty good.

From: Tim W4YN
Topic: 305 Message: 305

Adjusted the mic gain to get the QRP watt meter to show 2 watts with normal speech "hellooooooo".
Worked Kf5f on 20 meters, only a short hop maybe 400 miles, and he gave great report on audio quality, I was happy after hearing others had not been so lucky!

Tim,
I've worked a lot of DX with my X1M. My first QSO was an EA8 on 20 SSB.
Since then I've worked YY4, EA3, ON7 and IK4 all on 15 and 20 SSB with good
signal and audio reports. Have fun.

310. One more plus for the radio

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-20 00:20:12 UTC
From: George C
Topic: 310 Message: 310

In all the stuff I have written so far I forgot to mention one aspect that is stunning. Frequency reference. the internal TCXO is on 32.768 mhz. And the radio gets pretty warm from the .5 amps constant drain. Not sure what is drawing so much current. Probably the LM386 (:-) But measured on the same 40m frequency this thing only moved 3 Hz from cold to an hour later when it was very warm. And on all bands its error is a few hertz or so. That's pretty outstanding.

Yes George the unit does get warm, I really noticed that with the first model or Version 1 as well, maybe some venting would be needed or again maybe not, if it is stable as noted then we know it is not hurting anything.

George wonder if you can put your testing and measurements into some form of spreadsheet for some of to use and reference for when questions are asked..

And at the same time I hope many are reading your information and will ask questions if not sure of what you have found.

Great work

313. NEW Chinese HF Radio FT-808 UPDATE

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-20 02:55:25 UTC
From: Dale K
Topic: 313 Message: 313

For those of you that are interested in the Chinese HF Transceiver that was listed as selling for $400.00, here is the correct price on the radio. 6,000 RMB Chinese money =(USD $975.60) They said they never put $400 on there but we all can see that price on their reps ad. I am in China now on a buying trip and I had my Chinese assistant get this information for us. Anyone that wants to buy one, I will be happy to give you the direct contact number so you can order direct from the mfg.
Its normal for the Chinese to put a lower price on their ads just like they advertise the Wouxun 1P as a HF SSB Transceiver in some listings.

I can, but heading out tmorrow for a week, and probably not able to put much together. I really also wanted to make some more measurements at a specific set of frequencies.

Also, I see Po much better at 14 Volts.

I comment on the heat as a casual observation. But I do want to see where it is coming from.

GeorgeC

PS, fairly good interest in the radio preppers forum.

Just got this little radio set up over the weekend. No problems with the one I have. I really like it.
I would be interested in what power supply you are using in the shack or portable.
For now I am simply using a couple of lantern batteries. With the back light and preamp off.

I purchased a LCD monitor power supply. It looks like a laptop power supply
but rated at 12V @ 4amps. Ebay for about $7.

Group,
Got the X1M at Dayton. First QSO was from a motel in Clarion PA to Knoxville, TN. My antenna was an MFJ Telescoping antenna. Copy was good both ways. Radio was used as bought. Contact was on 17 M. I am looking forward to using the radio with a better antenna.

I can, but heading out tmorrow for a week, and probably not able to put much
together. I really also wanted to make some more measurements at a specific
set of frequencies.

Also, I see Po much better at 14 Volts.

I comment on the heat as a casual observation. But I do want to see where it
is coming from.

GeorgeC

PS, fairly good interest in the radio preppers forum.

Gang,

I just joined so I'll have to do some catch-up reading. Picked up my X1M at Dayton 2013. Got it home, dog tired, waited until I was awake. Still took me a while.

1. Is there a fix for the CW paddles being cast backwards (as in: TRS=dash/dot/gnd)?

2. RIT does not turn the preamp on or off. MD does that, at least on my radio.

3. A couple friends are serious CNC ops. They chuckled at the holes for the speaker grill. And I'm looking at how easily the radio & a huge pack of accessories (including a Z-match) would fit in one of the old Inmac A/B switch chassis I had planned to use on my own trx.

4. Overall, looks like a fun box. Once I recover from Dayton (and catch up on home projects &c) I'm gonna try it out with the AlexLoop I won at the QRP banquet.

Arvo , holding the RIT in for about 2 seconds gets you into the SYTEM MENU MODE, holding the MD button in will toggle the preamp as you stated.

Not sure about the cw paddle fix as I use straight key only..

323. After Dayton Update

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-20 16:33:05 UTC
From: kingfish_stevens
Topic: 323 Message: 323

As most of you know, the expected shipment of X1M radios got delivered in time for me to ship them out before leaving last Wednesday for Dayton. All on-hand orders were filled and the remaining radios were taken to Dayton. At least a dozen or more were sold there. At least 3 people reported on Saturday that they'd tried the radio Friday night, all with good results.

As with any new product, there are going to be growing pains and the X1M is no exception. I will tell you that positive reports are running about 98% so far. You guys that have found glitches, just be patient and I will get them all resolved.

I was without email since Wednesday because of a home computer problem I couldn't resolve by long distance. So I may just now be reading your emails. I'm working through them.

The factory is pleased that 100 radios have been sold so quickly. They are also aware of the problems that have been reported. More importantly, they are willing and anxious to resolve any problems. It will be the owners of this radio that will result in it being a really good radio in the end.

They are aware that poor assembly has caused some problems and they will fix that. They are aware of the reversed polarity for the keyer. That will be fixed by firmware, by me if needed. Yes, it seems that some things can be changed via firmware. And NO, it will not be a do-it-yourself project from what I understand.

What I need from you X1M owners is a report. I need information to pass along to the factory to correct problems or to improve the radio. PLEASE do not tell me things like it needs a built-in tuner or built-in 500 Hz CW filter, those ain't gonna happen. The basic radio is NOT going to change but quality control will get corrected and simple improvements are possible. One person suggested rubber feet. I thought of a front fold-down leg that would tilt the radio up in front. Give me your thoughts but don't be crazy.

Frequency jumping when using RIT. I notice this only happens with fast back-and-forth turning of the knob. There's no problem when turned slowly, one direction at a time. What do you see? These are the type of comments that will help improve this radio.

If you have a problem and you have the ability to troubleshoot it, I have no problem with you taking the radio apart and I will still honor the warranty. Hopefully you will be able to resolve the problem yourself. Here again, don't be crazy. Don't screw with it if you don't have at least a little clue of what you're doing. DO NOT REMOVE THE SILVER SCREW ON THE BOTTOM. This holds a nut against the power transistor and it will fall off if you remove the screw. In future models, I will try to get access to this screw blocked off.

Computer control. The factory has made an interface connector. I will try to get these shipped to me before the next shipment of radios are ready. Right now, these are still serial port connectors. I will try to get this changed to USB.

A schematic and block diagram of the radio is coming soon. I will provide this as soon as I get it.

That's all I can think of for now. Don't expect a quick reply to an email, there's about 500 in front of you.

Howdy,

If this radio will be firmware upgradable (even if not for DIY programming), this is fantastic.

Understanding that voice annunciation of parameters is likely impossible, and morse would be at least difficult, I'd suggest minimally high/low beep tones for on/off toggles, and a beep on the start of menus that wrap around that are set with rotary knobs. I understand this radio has knobs that click when turned, i.e. not a smooth tuning knob, which would actually be helpful for counting.

I'm still some intrigued by something on a Beagle Bone or Raspberry Pi or similar that would use Hamlib to interface with with a radio like this, then output settings and frequencies and confirmations and etc. through a software-based speech synthesizer like Espeak. More programming than I know how to do, but it would be motivation for me to learn.

Gang,

Reading back a couple pages worth of back-and-forths, I came up wondering if there is a list of issues for the X1M so I won't be bringing up dead matter as I get used to how things work?

So far I've got my own issues with the sidetone & level. Same as...

Couple other things every new radio's got, like birdies &c.

Don't understand how you can remove the board from the box without losening that screw but, hell, maybe there's a trick I ain't learned yet.

So far so good... Although no QSO yet. After I finish cleanin' the porch &c.

I got a radio from you at Dayton.
Have made a half dozen contacts on it so far on both CW and SSB. Just worked France on 15 CW. So I got three states and three countries with it in about an hour of operation.

It seems that most of the problems I have encountered are already known. The keyer paddle wired backwards is frustrating. I have been unable to get it to work with HRD.....

But, all in all and interesting rig for the money.

To adjust the sidetone you do not need to remove the bottom screw.

Steve was able to get his done today so he can maybe tell the rest of you guys how he took his apart.

I took version 1 apart and recall the 4 screws on front and back had to come off and plates removed.

The tuning knob and on/off knob also come off and the push buttons remain in place.

Now, if I recall, and I say IF, the top cover should slide off, Steve please correct me if I am wrong..

Be careful with the on/off button as it is tighter that the tuning knob.

Topic: 325 Message: 329

Thanks, Fred. The process was fairly simple. When I received the radio the sidetone was abnormally loud and very raspy....think it may have been from pure volume setting. This morning after seeing Fred's upload of the picture of the pot on the board I gave it a try. In the following order

Pop off the on/off and tuning knobs...they just pull off
Remove nuts and washers under the knobs
Remove the top and bottom allen screws(4)from the front and the top two from the rear panels
Carefully remove the front panel working around the small push buttons
Slide the top cover forward to remove exposing the circuit board
Id the pot Fred has posted in his uploaded photo
Couple notes: I found that the full range of movement from very loud to zero sidetone is about a quarter turn of the pot. Also as I was using a small metal Dollar Store screw driver I made the adjustments with radio off then turned back on to get a read....just didnt want to risk a short.
Reassemble is the reverseorder as disassembly
Now I have a much more pleasant side tone.

Subject: [X1M_QRP-Transceiver] Is there a list of issues? Gang,

Reading back a couple pages worth of back-and-forths, I came up wondering if there is a list of issues for the X1M so I won't be bringing up dead matter as I get used to how things work?

So far I've got my own issues with the sidetone & level. Same as...

Couple other things every new radio's got, like birdies &c.

Don't understand how you can remove the board from the box without losening that screw but, hell, maybe there's a trick I ain't learned yet.

So far so good... Although no QSO yet. After I finish cleanin' the porch &c.

Good deal, Ed. Seems like the shell/case/external stuff came last. The boards are very nicely done, the TCXO is rock solid. The spurs I noted are probably going to be some bypassing at mic connector or power input, I betcha. Especially when they changed as I touched the cabinet while transmitting. So the large issue from what I see is the LSB carrier freq. It sits about 1khz INTO the passband. If you fix it and move it out of the passband then the frequency readout in LSB is off by the amount you moved it. And IF shifting doesn't fix it, TCXO freq doesn't do anything, and not sure what that one is for.

I got power up to 4W+ when I stuck 14.5 volts on it.

Worked someone in CA on 20 with a very broken antenna this end.

Take care, they are both nifty...

Hey Buddy,

I'm eyeing a similiar project only I'm looking to use the Arduino platform to talk to the rig. I'm thinking of making a remote head of sorts that way (with a nice big smooth knob!!) and a loop antenna automatic tuner type of project where it reads the frequency from the rig and changes the loop tuning accordingly. I'm hoping to incororporate a true SWR reading/final tunning into that project as well.

If I don't the get hte library working maybe I'll try it on a RaspberryPi -- I've been looking for a project on that board anyway.

So yeah -- I'm itching to get the pin outs and the cables to start playing!

I think doing a speech synth like that should be pretty straight forward with ham lib-- make the call, get hte info, run it through a speech package. Good starter project -- heck I'll see if there is a speech package for arduino and keep that in mind if I make a remote head package.

334. 40m, 20m, 15m CW issues

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-20 23:00:15 UTC
From: Arvo Rantinen
Topic: 334 Message: 334

Gang,

Ok, maybe this has already been worked out but I have some interesting problems with what I can only call instability.

Noticed this yesterday & chalked it up to power supply. But after using a nicely regulated supply & even a battery supply, I am still finding the same troubles.

Happens on 40, 20 & 15. Noticed first on 40m but now seems to be on the two harmonics of 7 MHz too.

Turn on the radio. Key the tx on CW. Nice clean sounding note in another receiver (IC718), transmitting into a 50 Ohm 500W load (used by all the other HF rigs, so I trust that). Then within a few seconds of switch on, the CW tone becomes rough. And it appears not only on 7.001MHz but also up and down from that frequency, 10-odd kHz apart.

Turn off the rig. Wait a few seconds. Turn it back on, key some dits, same thing. Nice for a second or two then off into rough riders land. The change from clean to not so clean is almost immediate on 20m. On 15 it doesn't make much difference. Turn on, key, rough. Done.

Only thing I've done is open the box to try and adjust the sidetone level (from none to everything is the range I get out of less than a screwdriver blade width rotation).

Oh, and you can hear it do this on receive too. Hear a nice clean CW signal & then bleah. Birdies everywhere. Serious bad sounding AF, for want of anything else.

Reminds me of some experiences with a Chinese DDS VFO off eBay. (And the button functions on the X1M remind me of that particular VFO too. Maybe they's related?)

Ain't too sure this is the rig that's gonna go to the beach in a couple weeks.

Anyone have similar problem?

Nils

335. Preamp cutout at 7.150 MHz

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-20 23:30:53 UTC
From: kf9cm
Topic: 335 Message: 335

My first X1M was turned back in back in because of a intermittent drop out in the receive. My replacement radios preamp cuts out at 7.150MHz and below. When I come up to 7.150 the preamp comes back on. When the VFO hits that frequency I can hear a relay inside drop out. This does this on both A an B VFO on 40 meters only. I sure could use a schematic.

Hi Chris,

Well, being a blind op, I'm definitely not a hardware hacker (especially with the teeny tiny parts, but anyway…) So if I want to do anything in the home-brew arena, I'm going to have to learn to do some programming. If we can work up some sort of hardware platform with a (Arduin, RPi, something), buttons for freq entry and adjustments, and voice or morse output, I'd be willing to play. What say you?

Just had this same problem...
A solder connection in the microphone plug had come loose. I soldered it up and reinforced the strain relief, and added some tape as insulation inside the connector.

It seems ok now...

That is where the cutoff for the BPF is .Not much van be done about that.

Subject: [X1M_QRP-Transceiver] Preamp cutout at 7.150 MHz

My first X1M was turned back in back in because of a intermittent drop out
in the receive. My replacement radios preamp cuts out at 7.150MHz and below.
When I come up to 7.150 the preamp comes back on. When the VFO hits that
frequency I can hear a relay inside drop out. This does this on both A an B
VFO on 40 meters only. I sure could use a schematic.

Thanks for the reply Fred,

Shouldn't the BPF cut-out at 7.000MHz? Then there's the relay sound.

Filtering is set at the following, I will listen to mine again to see what it does.

Band 1: 3.5 ~ 3.9 MHz

Band 2: 7.0 ~ 7.15 MHz

Band 3: 14.0 ~ 14.5 MHz

Band 4: 21.0 ~ 21.45 MHz

Band 5: 28.0 ~ 29.7 MHz

They all do this. It even pointed this out in the specs. I agree, I wish it would go up to 7.300.
Thanks

Thank's for clearing this up Fred,

I was concerned because the noise level dropped down. I guess it's because the band width is narrowed.

Maybe there is country/region difference and US rigs need a firmware change. Mine does same thing.

It should be a trivial firmware change to move the switch points of the BPFilters. <unless> there is something in the RF chain that actually needs to have additional filtering.

Hopefully, the firmware can be re-loaded via the back DB-9 connector.

If there aren't any technical issues with the update, it would be nice for it to change at slightly different spots so there's not a click-click as you cross back & forth across the boundary. i.e. change at 7.005 going up, and 6995 going down.

Hi all.....
I joined this group to get involved with a new lightweight backpack style transceiver.
I think my expectations were hopeful this would be a decent radio for my upcoming trip.
After hearing the chatter about this unit. I can see it would be good to pass for my "needs". It would be nothing than heartache to be 50 miles in the wilderness with such a temperamental toy. The Chinese knew what they were saying when they called it a "toy". (correct translation) Where you fiddle with it to get it running and then at the quality of a "China toy" always needing a fix.

Bless all you for your time and investment I hope they pay you well for doing all the product testing.
My brother was involved with a product that i will not post and the prototypes were exceptional. When the $100,000 purchase went in the skill level from engineers to production was totally different.
this really effected them and there place in the market.

So a big thanks but no thanks. There is going to be an expense to get this unit correct. Engineering could be the best but the production line is not at the level of concern for the consumer.

I have great compassion for all you tinkerers that have invested with this toy. I don't have the skill or the time to makeup for a non-performing rig. I am reminded that I was in trouble thinking $300 would give me an $800 style transceiver.

This is not to point any fingers it will work out in time but my 300 investment is better spent towards a finished product and not towards an "idea" product.

Not sure i will stay on this group but good luck on this adventure.
Dean

348. That spurry signal problem again

Yahoo group: X1M_QRP-Transceiver (2013)

From: Arvo Rantinen
Topic: 348 Message: 348

Gang,

First, figuring that a good ol' eyeball inspection might help, I took the beast apart. Down to the little screw lets the RF tranny slide out the box. Then inspection with the magnifyin' loup. Couple possibly cold slobber joints but nothin' big.

Did notice the two VRs on the bottom board (7805 & 7809, if memory serves) were kinda bypassed weird but left that undisturbed by the disturbed mind.

So I put it all back together, tightened down the screws & fired the puppy up. Tuned my Sony SWL rx (SW7600) to the VFO freq & listened. Over the next minute & some, I could hear the rise of the spurry sig. So I blew on the top of the board . . . near the IC marked AD9851. Spurs gone. Wait, there they are again! So I took the tip of a screwdriver & laid it atop that IC. Noooo problem. Remove the screwdriver (now heat sink) and there's that spurry thing again.

Then. . . always touch something with your bare paws to see if it's hot.

Ya' think? Yep. Hot. So then I find the 5V line goes to that IC power pin. It's sittin' there quite happy at 4.98, even after the VFO goes to spursville. Hmmm. . . Part's gettin' hot. What could possibly cause a heat-up? And what amount of heat sink is needed? And why would I need a heat sink at all?

Good ol' SMD. Save space. No place for the heat, if you don't mind not askin' why the IC gets that hot anyway. Got some bar stock. Glue a heat sink on that sucker. Right?

Depending on the device size and location, I've had success with using various sized paperclips as sinks.

I say ALL ABOARD!

My time is going to be split coming up here but I'm totally intersted in this type of project. I did some poking around arduino vs raspberry pi and didn't find an obvious answer -- the arduino is easier for knobs and buttons but the raspberry pi is easier for speech. So it goes. The other negative to the arduino is I have to write/find a library to talk via CAT commands so it might be more of a pi place to start anyway.

How do you imagine the buttons working for freq input, etc?

> > > > I was without email since Wednesday because of a home computer problem I couldn't resolve by long distance. So I may just now be reading your emails. I'm working through them.
> > > >
> > > > The factory is pleased that 100 radios have been sold so quickly. They are also aware of the problems that have been reported. More importantly, they are willing and anxious to resolve any problems. It will be the owners of this radio that will result in it being a really good radio in the end.
> > > >
> > > > They are aware that poor assembly has caused some problems and they will fix that. They are aware of the reversed polarity for the keyer. That will be fixed by firmware, by me if needed. Yes, it seems that some things can be changed via firmware. And NO, it will not be a do-it-yourself project from what I understand.
> > > >
> > > > What I need from you X1M owners is a report. I need information to pass along to the factory to correct problems or to improve the radio. PLEASE do not tell me things like it needs a built-in tuner or built-in 500 Hz CW filter, those ain't gonna happen. The basic radio is NOT going to change but quality control will get corrected and simple improvements are possible. One person suggested rubber feet. I thought of a front fold-down leg that would tilt the radio up in front. Give me your thoughts but don't be crazy.
> > > >

> > > > Frequency jumping when using RIT. I notice this only happens with fast back-and-forth turning of the knob. There's no problem when turned slowly, one direction at a time. What do you see? These are the type of comments that will help improve this radio.
> > > >
> > > > If you have a problem and you have the ability to troubleshoot it, I have no problem with you taking the radio apart and I will still honor the warranty. Hopefully you will be able to resolve the problem yourself. Here again, don't be crazy. Don't screw with it if you don't have at least a little clue of what you're doing. DO NOT REMOVE THE SILVER SCREW ON THE BOTTOM. This holds a nut against the power transistor and it will fall off if you remove the screw. In future models, I will try to get access to this screw blocked off.
> > > >
> > > > Computer control. The factory has made an interface connector. I will try to get these shipped to me before the next shipment of radios are ready. Right now, these are still serial port connectors. I will try to get this changed to USB.

I got an email from Ed Griffin asking for a photo of the offending chip. So I sent him one. I'll try to post the pic on the appropriate archive.

I've worked with a couple Chinese issue DDS VFOs & they too have a serious heat exchange problem. I don't understand how some of this stuff works, set at the pre-bleeding edge of the incision.

For the moment I'm gonna superglue a penny on the IC (with appropriate insulation [cardboard]) so it'll smoke better when it gets too hot.

And maybe a hole or two in the top of the case over the IC so it gets heat exchange.

Flashback to the IC706 heat/fan issue some folks get all wonked out of shape about.

Howdy,

I guess that would depend somewhat on what's available for inputs. I mean, if we were to do rPi, probably something even as simple as a USB numeric keypad would work. I *think* that someone got Hamlib to compile on RPi, too, which is great, since it has Icom support, so lots of the work is done. I think.

resolve by long distance. So I may just now be reading your emails. I'm working through them.
> > > > >
> > > > > The factory is pleased that 100 radios have been sold so quickly. They are also aware of the problems that have been reported. More importantly, they are willing and anxious to resolve any problems. It will be the owners of this radio that will result in it being a really good radio in the end.
> > > > >
> > > > > They are aware that poor assembly has caused some problems and they will fix that. They are aware of the reversed polarity for the keyer. That will be fixed by firmware, by me if needed. Yes, it seems that some things can be changed via firmware. And NO, it will not be a do-it-yourself project from what I understand.
> > > > >
> > > > > What I need from you X1M owners is a report. I need information to pass along to the factory to correct problems or to improve the radio. PLEASE do not tell me things like it needs a built-in tuner or built-in 500 Hz CW filter, those ain't gonna happen. The basic radio is NOT going to change but quality control will get corrected and simple improvements are possible. One person suggested rubber feet. I thought of a front fold-down leg that would tilt the radio up in front. Give me your thoughts but don't be crazy.
> > > > >
> > > > > Frequency jumping when using RIT. I notice this only happens with fast back-and-forth turning of the knob. There's no problem when turned slowly, one direction at a time. What do you see? These are the type of comments that will help improve this radio.
> > > > >
> > > > > If you have a problem and you have the ability to troubleshoot it, I have no problem with you taking the radio apart and I will still honor the warranty. Hopefully you will be able to resolve the problem yourself. Here again, don't be crazy. Don't screw with it if you don't have at least a little clue of what you're doing. DO NOT REMOVE THE SILVER SCREW ON THE BOTTOM. This holds a nut against the power transistor and it will fall off if you remove the screw. In future models, I will try to get access to this screw blocked off.
> > > > >
> > > > > Computer control. The factory has made an interface connector. I will try to get these shipped to me before the next shipment of radios are ready. Right now, these are still serial port connectors. I will try to get this changed to USB.

Gang,

I have the X1M boxed up again. Superglued a piece of tin sheet across the top of the AD9851 VFO IC to dissipate the heat that was driving the VFO to squirrelliness. Spur signals. Whatever.

The heatsink is tabbed so the top cover slides over it & makes nominal contact with the top cover. That spreads the heat around even more.

With just the heat sink, the chip would just get to the edge of going nuts. Fanning air over it, the output went back to what you want to call normal. Thus the idea of having the top cover slide across it.

Adding that picture to the trove. I get industrious I'll get on the air . . . provided things stay "stable."

Gang,

My X1M works FB on CW.On SSB I cold not get it to xmit. After moving the rubber housing on the 1/8 in plug back a bit,it works FB, but you also have to find the sweet spot when plugged in. I think the issue is that there is too much tolerance between the female/male plug. So, if you can't get your X1M to work on SSB, be suspicious of the mike plug.

You can get copper chip heat sinks with heat transfer double sided tape off E-bay I had to use some for another DDS heat generator chip that was getting quite warm (hot!) When I get home tonight I will post a picture of them and the package they came in, quite cheap from China.Tim O W4YN

I was going to post the same thing but decided it was just a dumb mistake on my part.

I initally couldn't get mine to transmit on SSB, then I realized that I didn't have the mic connector in the jack all the way. I didn't have to modify anything, I just pushed harder and it went in.

The ones I had were too tall, milled one down to .100 and case barley missed touching it, will try one just a tad thicker tonight.

Group,

The manual indicates 9.6 to 14.5 VDC. Mine does not like anything less than 11.45 VDC. It starts to howl with less. Anyone have one that works below 11.45 VDC? .

George

Y'all,

So am I the only one with a heat/VCO problem or have others noticed that this chip (AD9851) gets a bit warm to the touch?

And if so, how many other folks have found that cooling the VCO IC cleans up the signal on rx or tx?

I'm pretty sure I've seen this IC before in DDS VFOs or somewhere & that it does get hot. Which would mean either I have one that's on the edge of acceptable or others are just lucky & have cooler environments in which to play radio. If just blowin' on the board (which is how I discovered it) is enough, well . . .

After seeing this I took the top cover off mine last night. That chip gets hot. Not sure if it was you or someone else said they superglued a penny to the top of the chip. I did this and it seems to disapate the heat. We'll see hoe it works.

The AD9851 does run hot, very hot, it is designed to take this. There was extensive debate in another group over heat issues on this chip and it seems the Mfg has taken this into account with design. I also used thermal tape and chunk of copper just to be safe though.

I think your right Buddy. I'm going to start a seperate thread along the lines of homebrewing interfaces with Icom CI-V to move this discussion to.

I'll post my thoughts over there but I do agree I think most of the work is done.

I thought of a front fold-down leg that would tilt the radio up in front. Give me your thoughts but don't be crazy.

> > > > > > Frequency jumping when using RIT. I notice this only happens with fast back-and-forth turning of the knob. There's no problem when turned slowly, one direction at a time. What do you see? These are the type of comments that will help improve this radio.
> > > > > >
> > > > > > If you have a problem and you have the ability to troubleshoot it, I have no problem with you taking the radio apart and I will still honor the warranty. Hopefully you will be able to resolve the problem yourself. Here again, don't be crazy. Don't screw with it if you don't have at least a little clue of what you're doing. DO NOT REMOVE THE SILVER SCREW ON THE BOTTOM. This holds a nut against the power transistor and it will fall off if you remove the screw. In future models, I will try to get access to this screw blocked off.

368. Homebrew Interfaces via Computer Control

Yahoo group: X1M_QRP-Transceiver (2013)

From: ballardian36
Topic: 368 Message: 368

Just a thread for anyone thinking about homebrewing an interface for the x1m through the icom ci-v command set.

I'm looking at using an arduino but the raspberry pi also seems like a good start.

Buddy -- I think you are right -- going raspberrypi, espeak, and hamlib, + a usb 10 key is probably a great place to start with for what you are talking about doing. I'm thinking python is a good language to start in I think speak and hamlib both support it and it doesn't have to be compiled (but it can).

I'm leisurely throwing together a dev environment no on a rpi but a standard box to see what I can see and play with it a bit. Of course not much we can really do until the cables come in or we get a schematic.

I'm thinking that if the Linux FTDI chip set driver is available for the RPi, that would mean one less interface headache, since USB to serial adapters could be used to go from the radio to whatever, since the other endif whatever cable we end up gutting will expect a PC at the other end.

I'll have to look into that, but if you get something together, let me know about the pieces you put together and I'll play along. (Especially if I don't have to solder anything, LOL) Because I've also got some stuff I want to do with the Elecraft KX3 in a similar vein, but that will be even easier since it just uses plain text commands sent over a serial port.

Someone correct me if I'm wrong but doesn't the Raspberry Pi have the
option of an add on serial port? Steve KB1CHU

I agree I hope the x1m uses a standard TTL level serial adaptor that we can use what we've got around to make it virtual com on the raspberrypi and then straight into the x1m. (I also hope this because it makes the arduino easyyyy).

I played today and got a basic setup working (Sans the x1m ironically) I was using Zorin (Ubuntu 12.04 OS) with hamlib, espeak, speech dispatcher, python, and Eric's Python IDE. Hamlib, espeak, and Eric's python IDE I had to install (I'm not sure I can walk you through exactly which packages I used at this time it was a bit confusing and I might have added hamlib from a ppa or I might have just found it in the normal repository).

Speech dispatcher (http://devel.freebsoft.org/speechd) seemed to have already been installed by the time I went looking for it. Not sure if it came with my OS install or if something else I installed did the trick.

As proof of concept I used hamlib's built in 'virtual test rig' and used that to call information out of. The script starts and reads the current frequency and mode outloud. Then it waits for input. At this time I have the following setup:

+[enter key] = read current operating frequency outloud
-[enter key] = read current operating mode outloud
++[enter key] = change frequency input requested
--[enter key] = change mode
any other key = try again

the script will just complete the task and then go back to waiting for input.

Off the top of my head I was keeping the number keys open for input and using the other leys /,*,-,+ as 'function' keys of a 10 key to keep it simple for now. Also, with the simple input function I was playing with you have to hit enter after your 'selection'. I haven't really tried to send/set the frequency in the rig yet as it doesn't make sense to even test that on the fake rig... I'll play with that when we get the x1m cable.

The script is currently really messy and not commented (or very commented out as I worked from examples and removed code). But I can upload it if you are interested in playing with it. It is just a .py text file and any python IDE should work with if you have the right bits installed (I think).

Let me know if your are thinking of a different method of inputing things to get results -- differnet keys, or combinations or whatever. Shouldn't be to hard to change.

-Chris

Howdy,

I don't have one either, and I still have to learn python. Actually, was wondering about the Pi, do you have one? Thinking I may just get a Pi plus case, power adapter (or maybe just one of those little USB battery packs) and get going. So did you do this stuff on the Pi or with a regular Linux box? I actually have a Linux machine at my disposal, so I can get started with learning python. Right along with learning asterisk dial plans :)

Haha I don't have a pi either :) I'm just doing this on a standard linux install first. I too and learning python right now on the fly :) It isn't to bad so far -- a couple syntax bits I keep forgeting.

I do have an arduino but no pi at this time :) If we get it working on the linux box the next key to port to pi will be getting the right libraries installed on the pi (or compiled if we are unlucky). I suspect it isn't going to be that hard -- I'm using pretty standard stuff.

So it goes.

374. Rotary Encoder

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-24 23:48:10 UTC
From: dyarnes1
Topic: 374 Message: 374

Hi All,

I'm trying to help a new owner check out his X1M. My first impression is that the encoder is either faulty or of poor quality. This one seems to be frozen almost. It will not rotate freely, and depressing it to change to the alternative feature does not work at all now. It worked for a bit, then stopped all together. The owner said he noticed some change over time as well.

Has anyone else experienced this? I'd also like to know how other encoders seem to function. Are they relatively free acting (as just about all other rotary encoders I've used), or does it tend to be sticky and stiff?

Mechanically, I don't know if there is anything you can do about an encoder that exhibits this problem.

Dave W7AQK

Hi,

I expect you're right, it shouldn't be too awful. I know there's someone who got ham lib going on a Pi, and I know speak works too since there's a distro that has emacspeak baked in, and that needs speak or something to work. I understand python is easy enough; I haven't done anything since annoying my computer lit teachers in high school and a semester in college of pascal, and that was, what, 20 years ago? I think the most challenging bit for me will be getting the indents right, because they tell me that the tabs and spaces actually matter.

Yes you need to put a piece of paper in the encoder knob to bring it out a bit to allow the pressing of the switch to change bands.. The encoder rotary issue I have had no problems with.

Subject: [X1M_QRP-Transceiver] Rotary Encoder

Hi All,

I'm trying to help a new owner check out his X1M. My first impression is that the encoder is either faulty or of poor quality. This one seems to be frozen almost. It will not rotate freely, and depressing it to change to the alternative feature does not work at all now. It worked for a bit, then stopped all together. The owner said he noticed some change over time as well.

Has anyone else experienced this? I'd also like to know how other encoders seem to function. Are they relatively free acting (as just about all other rotary encoders I've used), or does it tend to be sticky and stiff?

Mechanically, I don't know if there is anything you can do about an encoder that exhibits this problem.

The db-9 pins are at either zero volts or +5 (ok, +4.93 in my case)with the exception of one pin that either ahs some sort of analog info...or more likely is real high impedance something because the voltage is always different and when looking at it I can watch it go down...

So, probably TTL. I may start guessing serial parameters and goof with some of the pins. Since it may turn out that cable info isn't available, though I'd surely expect that should be provided.

I don't like buying pre made cables when I can put one together myself.

I found another instance of this, but it was because the CW key contact was "made" (plug shorted) During that short the encoder did odd things.

Well if it's "designed to take" the heat, the one I've got ain't that high on the evolutionary scale yet . . . or is outright defective.

Had the rig on 20m this morning after a nice chat with a guy down the road on 40m. Noticed straight off that the VFO had gone all spread spectrum on me. Turned it off & back on. Got the same heat-related unlock on 20m, even with the heat sink & top cover &c, that I'd gotten on 40, which had led to the discovery in the first place.

Was wishin' I had a way to record the diff as I listen to the VFO on another receiver so I could send it to either the vendor, mfg or both.

Truth up, it's kinda frustrating to have spent this much on a radio that's more temperamental than a sociopath four year old. Can't trust it one way or the other. And I'm not in the mood for hassling with sending it back or messin' with it any more. I simply don't need the frustration. So back in a box it goes.

Excellent info George! Glad to hear it likely TTL. I too would rather build a cable -- I've been building and altering cable for all my rigs recently. I ordered a few bare board TTL convertors from ebay I'd like to use.

I expect it to follow Icom's CI-V protocl which should just be a single line for TX/RX (bound togther) and a single line for ground. At least that is how the CI-V bus seems to be wired.

But its possible it has it's own magical break out from that 2 wire to a different wire arrangement. When I pulled off the case I tried to follow the traces on the board to see what I could see and nothing was illuminated.

Also -- if you haven't seen them yet there ar ea few CI-V test programs that send a single command and see what the response is. Might be good for probing the wires instead of going all out on HRD.

http://www.plicht.de/ekki/software/index.html

Dos based -- http://www.plicht.de/ekki/software/cmdline.html

HEX command based -- http://www.plicht.de/ekki/software/civtest.html

Once I get the pin outs working I was planning on using the HEX one to walk through the Icom command set to really see exactly which commands the x1m supports of the 718's command set.

Topic: 382 Message: 382

Happy Sunday everyone...

I bought an X1M transceiver at the Dayton show last weekend. This week gave it a try and could receive nothing. Then I turned on another receiver with the same results - hardly any signals anywhere in HF bands. I guess there must have been a solar flare or other propagation problem.

I checked the transceiver on a service monitor - rx sensitivity is about 0.5 uV and output was about 4 watts. On SSB the carrier suppression didn't seem as good as I'd like - rough estimate of -35 dB by eyeballing the little spectrum scope on the monitor..

The adjustment of the signal frequency relative to the filter in LSB mode is pretty far off, making everything sounds very dull and muffled. As-is, I would consider this rig to be unusable on lower sideband. USB and CW seem fine.

Thanks for the post Steve . I wish everyone that owns one or who was involved in the Beta testing of it would post their comments and experiences , both good and bad .

There just doesn't seem to be a whole lot of in depth information out there anywhere about the rig and its quirks and also its strong points .

I ordered one last night , but am not really sure from the USA web page as to exactly when it will ship . I do expect there to be a few bugs in it as with any new rig , but knowing as much as possible about the rig in advance , we will know what to expect the present "normal state" is .

Also I have not seen any warranty information on it .

Another question is the oscillator frequency for the AD-9851 . Since it covers 10 meters , I am kind of surprised that it doesn't also go on up to 6 meters . Most of the AD-9850's that I have , use a 125 MHz. oscillator module and I have seen guys squeeze them up to 6 meters .

It looks like it is going to be a rig that will see a LOT of additional ham changes , additions and accessories for .

I had just made an attempt to buy a non ND , FT-817 , over the weekend . The fellow never got back to me when he said he would , so I went ahead and ordered one of these . It appears even better suited for all of my experiments , than the FT-817 , so I "think" I got lucky . I wasn't looking at the 817 for the ham bands we have now , but to use on MF and LF bands , that are presently part 5 or part 15 experimental bands , plus it will allow me to use it as an IF rig for my transverters for those frequencies .

Anyone else with one with additional comments so far ?

Yes I agree and have said the same thing, Ed is reading and listening to the comments and has made some suggestions to the builders and designers of the X1M.

This unit has lots of potential and with minor tweeks I think we can see some great portable operations.

I have posted all of my findings, to the files section and even posted the August 2012 first review and the April 2013 review.

Charlie,

Interesting that you were after an FT817. I had mine out in the yard this morning playing with the AlexLoop I won at the QRP banquet (which was a surprise, you bet).

I'd kinda stopped messin' with the '817 'cause I got kinda tired of pushing buttons to go to menus & move things around. After having played with the X1M long enough to get really frustrated with it, I found the '817 exceptionally easy to use. Yeah, even the keyer was nice . . . but I can chalk that up more to the Begali Simplex paddles (which are strangely more controllable with my essential tremor than any other paddles I've used).

If I hadn't called a "back-in-the-box" truce messin' with the X1M I'd take it out in the yard tomorrow and see if I would be less impressed.

Think I'll sit back and pet the yard cats.

Hi Nils ,

Well I hope I don't regret the decision to go ahead and buy one of the X1M's . I really would have preferred it to be in kit form along with open source codes . That way I could have really customized it just the way that I wanted it . But I can't do hardly any surface mount soldering because of tremors or I would have built my own .

I am pretty much home bound and an old bachelor , so I spend all the time that I want building no matter what time day or night that it is .

Yes I was looking for just the old non ND FT-817 , that could have even had bad finals in it to make it easier to experiment with a lot of things that I build , but need a fairly decent radio that I can use as the IF for . I have an FT-857D so I know what you mean about the menus and the frustration .

What do you think of the AlexLoop ?? I spend almost all of my time these days , designing , building and operating from just above DC through about 2 MHz.

When I get my X1M , it might just frustrate me enough that we will have to get together and provide therapy for each other . <grin>

Here's hoping you and it get along better together and that the darned thing works out for both of us.

73 ,
Charlie

From: Papadad
Topic: 387 Message: 387

For sale. X1M rig, mic, booklet. $285 shipped to your door. Continental USA only. Less than 30 minutes of indoor use. Ping me privately by email if interested.

This is my own unit, tested working properly and will be hand carried from my qth here in china to usa on Saturday June 1 .

Pics on request. If not sold here, will go on qrz.com or ebay so grab it now !!

Yeah the indents are driving me nuts! Not bad just like REALLY? Ha

What features are the most important for you to access? So far I have frequency read and write, mode read and write. I'll work on adding the ones you want next when I play again.

I know there's someone who got ham lib going on a Pi, and I know speak works too since there's a distro that has emacspeak baked in, and that needs speak or something to work. I understand python is easy enough; I haven't done anything since annoying my computer lit teachers in high school and a semester in college of pascal, and that was, what, 20 years ago? I think the most challenging bit for me will be getting the indents right, because they tell me that the tabs and spaces actually matter.

Thinking I may just get a Pi plus case, power adapter (or maybe just one of those little USB battery packs) and get going. So did you do this stuff on the Pi or with a regular Linux box? I actually have a Linux machine at my disposal, so I can get started with learning python. Right along with learning asterisk dial plans :)

I can usually go about 2 hours before my goes wacky, but its in a cool environment. Got the LSB sounding OK now anyway by dropping the injection frequency a few hundred Hz and retuning.
Will try some ventilation and heatsinking and hope for the best...

Hi Dick ,

Still not much information out there that I have been able to find .
Mine is on order , but looks like it won't ship until the middle of June .

Can you provide , even off list , some more details about the nitty
gritty of the rig .

I am curious what frequency oscillator that they are using with the
AD9851 .

Another question is on the rear apron they appear to have a jack for
either headphones or an external speaker . Could you fill me in which it
is for ?

Can a person set the BFO frequency ? Do you happen to know what the
default frequency is ? How is it as a QRP CW rig ? How close can one
comfortably operate to another station ?

I am just trying to get an idea as to what accessories that I might want
to build to use with it . It would be nice to see a schematic of it and
also perhaps what the menus contain . All I have seen is the 7 page
instruction manual , which tells me very little . It looks like I have
plenty of time to build up a few accessories if I just had more
information .

Have you tried to control it with HRD yet ?

Sorry for all of the questions , but I really would like to know more
about just how the radio operates and what I might want to add .

I don't know how many people have one yet , but I do wish they would
publish their experiences with the rig , good , bad , or otherwise .

BTW is the current draw on receive as high as they list it and is that
with or without the back light on ? (I guess the display is also the
only indicator whether the rig is on or off from the pictures.)

Thank you .
Best 73 ,
Charlie , W5COV

Dick what was the steps you took to get the LSB to frequency? Just so others have an idea as to what you had done since I think they all have the same issue on LSB.

Did you adjust from the setting in the radio menu or actually from the radio innards ?

If from the menu what was your default setting and then the setting after you were done?

Fred

392. Observations/Ideas on the X1M - 1st post

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-05-31 19:22:17 UTC
From: pal350
Topic: 392 Message: 392

This is info I've already sent to Ed at Import Comm. I went to their booth at Dayton on Sunday to buy an X1M but they'd already taken off. Ed had a few left, one of which he sent, and I got it a few days ago. My immediate observations and impressions are shown below.

Included is a first shot at a canned procedure for getting the settings correct.

Are any of you guys experiencing the unwanted spur at the dial freek + 9.0 MHz as outlined below?

The single best thing they could do is add the rest of the U.S. 40 and 80m bands to the filtered coverage, IF the filters are wide enough.

Sent to Ed:

Most important concern: the apparent lack of transmit path filtering anywhere outside the five bands "configured separately with optimized filters". Like I mentioned before, it looks like that latter statement means there's NO filtering outside those ranges. The problem manifests itself with an obvious symptom: output from the transmitter in USB or LSB when the PTT is pressed and NO modulation is present. I thought it was a carrier balance problem at first.

I've found that the unwanted output is always 9 MHz above the indicated frequency. That is, if I have the radio set to 3.996 and key the mike in LSB with no modulation, the major output spur is 12994.3. That's a difference of 8998.3 which is 1.7 Khz below 9.000. Guess what happens when I switch to USB? Yep, I get 12996.5, a diff of 9000.5. Taking into account the errors in my crude test equipment and the fact I've only set up the radio by ear, I'd say this is an indication they are using a 9 MHz I.F. AND, I'm guessing the oscillator is leaking through to mix with the DDS output and getting to the P.A. Just a guess - but maybe they are filtering the 9 MHz oscillator in the filtered ranges but not elsewhere.

[Added later: There is a GIANT RX birdie at 9.000 MHz. :)]

Something strange has happened since we last talked. Before, I was getting unwanted output at levels between 400mw and 1.5W depending on frequency. Now I'm getting no more than 500mw:

Freq	Level of unwanted output at Freq + 9 MHz
3.996	400mw
7.268	500mw
18.157	400mw
5371.5	400mw
1.996	300mw
7.275	500mw
7.299	500mw
7.151	500mw
10.100	400mw
24.930	250mw
7.160	500mw

This is still an unacceptable percentage of the rated output but at least the radio doesn't seem to be going ape like it was before. This is the #1 issue IMHOP. My QRP SWR bridges and tuners won't work right with that level of spurious output.

This could be mitigated somewhat by filling out the 40 and 80m ranges to the current U.S. standards.

3.5 - 3.9 opened up to 3.5 - 4.0
7.0 - 7.15 opened up to 7.0 - 7.3

The other bands are okay.

At a bare minimum, the rest of 40 and 80m U.S. bands should be added to the filtered range. Others may have different ideas which other bands should be added, but if it were me, I would want 17m added first (18.068 - 18.168), then 30m (10.1 - 10.150) for the CW guys, and last 12m (24.890 - 24.990). 17m is very important in the U.S.

because it's heavily used by HFpack lo-power man-portable (pedestrian mobile) stations on 18157.5.

When you mentioned the possibility of getting a way to update the firmware, I thought of something. If the 80 and 40m filters are wide enough, MAYBE all that's necessary is a firmware update to enable the filters over the slightly-wider ranges.

I thought of something else. Generally, QRP operators use small tuners to match the 50-ohm radio outputs to various antennas. Would a tuner suppress the spurious output? If so, how much power would actually be left on the operating frequency? I set up some tests into a 50-ohm dummy, but immediately ran into problems. I use the "BLT" tuner, the original version of this:

http://www.qrpkits.com/blt_plus.html

You tune for minimum brightness of the LED in the TUNE position, then switch to OPERATE. In TUNE, the xmittr is tuned across an absorptive bridge so you don't risk the finals. I found the tuner worked normally inside the five ranges but was "confused" by the spurs and wouldn't give a dip indication anywhere outside the five filtered ranges.

The first freek I tried was 7.150, inside the 40m range, and the tuner worked correctly. I then switched to 7.149, heard a filter relay click, and the tuner would not find a match. In fact, I couldn't get the tuner to work anywhere outside the filtered ranges. The SWR meter didn't work either. {Added later: SWR bridges tend to be more sensitive at higher freeks - since the spur is always 9 MHz over the primary, I figure the higher freek is affecting the reading out of proportion to it's actual level).

~*~

On fiddling with the settings on the System Menu: My radio came with oddball settings. The USB filter setting sounded reasonable, but LSB was clear out of the I.F. passband. CW was way high. So I put in the VE3FAL settings, which moved everything even further off.

Here's what I did:

SETTINGS I DON'T KNOW ABOUT, so set to defaults:

1) Set RCLK Ratio to x6 (need to find out what this is)

2) Set DDS Clock to 032768131 (VE3FAL setting)

DO A FIRST ALIGNMENT APPROXIMATION. This should ensure your sidebands are at least somewhere in the I.F. passband.

3) Set up a local accurate xmitter on LSB into a dummy, set X1M to LSB on that freek

4) While xmitting on the local radio, adjust X1M LSB BFO setting until the received audio is correct.

5) Change local radio to USB. While xmitting on local radio, adjust X1M USB BFO setting until the received audio is correct. Skip the CW BFO setting for now.

ADJUST THE I.F. OFFSET. This should (at least roughly) center the I.F.

6) With an antenna connected but no signal present, move back and forth between USB and LSB. They should sound about the same. If you've heard HF SSB before, you'll have a feel for what a voice-bandwidth SSB filter sounds like. In my case, USB sounded pretty close but LSB sounded muffled. So I got into the IF OFFSET setting and fiddled with it until I got about what I wanted, then saved the settings.

CLEAN UP THE USB BFO AND LSB BFO.

7) If you make any change to IF OFFSET, you'll need to re-do USB BFO and LSB BFO. Now SSB sigs coming in should be zero beat (or close) on both USB and LSB, and the two should sound close to the same when you switch back and forth with no signal present. With no block diagram or schematic I can't say for sure this correct, but it makes sense.

ADJUST THE CW BFO.

8) Once the I.F. OFFSET is close and the two sidebands sound roughly the same, you can adjust the CW BFO. While xmitting an 800 Hz CW tone on USB over a local transmitter to the X1M set to CW mode, I adjusted the CW BFO setting until the received audio zero beat with the local xmitter's 800 Hz audio sidetone. You may want to set it a different way.

My eventual settings. I'm thinking every set will be different:

Setting VE3FAL value My eventual change

IF OFFSET +08999830 +08999530 (-300)

LSB BFO 08988750 08998386 (+9636)

USB BFO 09000850 09000590 (-300)

[Added later: Somebody yell if I made any giant mistakes)

~*~

Less important issues...

#3: Include a way to turn off the beeps! The first thing I do when I get any radio (or install Windows XP) is turn off every %$#$ing sound. With the X1M it's even more important - they are LOUD. MD button doesn't have a long press function - how about use that for DISABLE SOUNDS?

#4: Error in manual: On pages 7(top), it says the RIT button is used to turn on the preamp. That led me on a merry chase. Manual correctly mentions using the TS button elsewhere. Maybe the Vsn 1 radio was different?

#5: The radio runs pretty warm - probably the cause of the heat problems mentioned in the X1M Yahoo Group. Most of the RX current is probably being dumped into the DDS chip. :)

#6: What do RCLK RATIO and DDS CLOCK do? I messed with them some and they didn't seem to change anything. I have the VE3FAL settings in now for these two.

#7: It would be VERY useful to be able to vary the power output. Many QRPers like to try one watt or less.

~*~

Here are my questions for the developers, stated as simply as I can manage.

1) Connect watt meter, dummy load, and mike. Set radio to any frequency that is NOT in the five bands with filters. Key the mike. Radio will produce spurious output at the dial frequency + 9 MHz. My level is between 0.25 watt and .5 watt.

Do you use a 9 MHz I.F.? Is a 9 MHz oscillator mixing with the DDS output and getting to the output stage?

My low power watt meters and SWR indicators will not work. They are confused by the spurious output which is 9 MHz above the dial frequency.

This spurious output problem does not happen inside the five bands with filters.

Can you fix this spurious output problem?

2) USA amateur bands are different than foreign bands. Very important to have the complete 80 meter band 3.5 - 4.0 MHz. Very important to have the complete 40 meter band 7.0 - 7.3 MHz. If the filters are wide enough, can you do this with a firmware change?

3) Is it possible to add a filter for the 17m band 18.068 - 18.168 MHz?

4) What is the function of RCLK RATIO and DDS CLOCK?

5) I do not like the beeps. It may be possible to use a long press on the MD button to turn off all the sounds?

6) Add this to the radio? -- A way to set the power output from zero to full output.

Fred and the group,
    I see everyone talking about not having a schematic. I haven't bought a radio, but I have been closely following the threads. How are the kit versions being assembled? Is there a schematic included in the kit form?

Here's the problem I found with that: yup, you put the carrier in the right place relative to the filter. But now the displayed frequency in LSB is off by that amount, and no way to fix that.

Hi all,

A big thank you to Mark for all of the details!

After reading through his post I tried a few things with my X1M attached to an Emtech ZM2 tuner, which also uses an LED to indicate SWR. Hooked up to a 60 foot random wire in trees, and a 9:1 unun, I tuned up on 3899kHz, and was able to get the LED on the ZM2 to go out completely, indicating close to a 1:1 SWR. 1kHz up though, on 3900, it only dims.

Same thing was noticed between 7149 and 7150.

Also a quick 'meatball' test for spurious emissions. A small Grundig SW portable seems to receive noise on almost any frequency above the transmit frequency when nearby with the attenuator on full if I transmit outside of the filtered areas (PTT down, and no audio), and if I transmit within the filtered areas, there is no noise on the Grundig.

I'm thinking that I should NOT use this outside of the pre-designated filter-enabled areas for now.

I'm definitely getting a signal out when I'm outside of the filtered area on 40M as I have been able to check into a couple of nets that are well above 7150, but I'm guessing that it must be less than optimal. Most of my good contacts have been on 10, 15, and 20M. More incentive to move up to Extra I guess, so I can use some of that sub-7150 area.

Has anyone else tried this on 10 Meters? The same test on 10 seems to be OK for me, yet I do not hear the filter click in for 10.

I hear the difference in USB and LSB when I zero-beat on WWV, but I will wait to change those settings until I learn a bit more.

Keep up the good work everyone, and thank again to Mark!

George et al,

Did you guys see my first post #392? I have a procedure (I hope) for getting USB/LSB configured correctly. It's kinda buried in there - I get verbose.

Shortened version:

1) Set the IF OFFSET first, or you'll chase yer tails. With the radio hooked to an antenna receiving noise but no signal, fiddle with the IF OFFSET setting until you can switch back and forth between USB and LSB and the "wooshing" or "timbre" sounds about the same. All the radios are bound to be different, but I set mine -300 from the value in the manual. Save the setting.

2) NOW adjust USB by moving USB BFO until a voice signal received from a local accurate receiver is correct. Save the setting.

3) Adjust LSB by moving LSB BFO until a voice signal received from a local accurate receiver is correct. Save the setting.

4) Adjust CW only AFTER you do the IF, USB, and LSB. I adjusted CW by setting the X1M to CW, and while receiving CW from my PRC-1099 (which xmits an 800 Hz tone on USB), moving the CW BFO setting until the audio from the X1M zero-beat with the 800 Hz sidetone coming from the 1099. Save the setting. You may want to do it a different way.

5) Write down your settings for IF OFFSET, USB BFO, LSB BFO, and CW BFO. :)

Key: Set the IF OFFSET first or you'll go in circles.

Hi Joe ,

I just ordered one last week . Guess I shouldn't have been so anxious :)
You wouldn't by chance have a schematic of the rig would you ? I would
like to get a bit of a head start on learning the rig and seeing what
improvements or accessories that I might want to build to use with it ,
while I wait for its arrival .

Thank you ,

Has anyone else tried this on 10 Meters? The same test on 10 seems to be OK for me, yet I do not hear the filter click in for 10.

***I think they use one filter for 21.000 HMz and up...

---> I can hear it click-out at 21450, and it does not click again all the way to its upper limit of 29999. So if it is filtered, they are using something different there.

I don't have a freq counter, but these observations do explain why my work on certain bands had a profound effect on my XYL's computer monitor, and the speaker system I have attached to the TV (which goes crazy on 17M).

If the spurs are 9000 up, that puts the main spur for 17M right in the middle of the 11M band. Would it be noticed? Just kidding....

I'm hoping that the filters are re-programmable through firmware, but if not, it still is a nice little rig for 20, 15, and 10 for now.

Hi Guys,

I was just trying to connect my X1M to the notebook and Ham Radio Deluxe. I am using a serial to USB converter (that I use to communicate with my TS-480 so I know the cable is good). HRD is looking for a CI-V address and I have no idea what address the X1M uses when configured as an IC-718.

I have only had this rig for a few days, so getting to know my way around it slowly.

Any tricks you guys with more hands on time worked out yet?

Best regards,

David Tavener - vk4ice

Guys I have a factory made cable that I have been trying to get working as well. The short cable only uses 3 wires, but the end marked computer does have a chipset in it. I have tried to connect using HRD as well with no luck, I use auto and it will not pick it up, now I am using the cable, a gender bender to go to my RS232 to USB cable, cable is getting commands from computer but not the radio.

Thanks for the tip Mark. Today I was finally able to adjust the IF offset setting, then the three BFO settings, to get proper filter action and dial reading. Whew - now the transceiver is actually usable.UNSUB

From: nvolle@sbcglobal.net
Topic: 405 Message: 405

Topic----X1M variable power output problem---and
keyer dropping characters.

I think this is a promising QRP transceiver and look forward to using it when the bugs are worked out. I encountered a problem though, on my second 40 meter CW contact when I was told I was dropping characters.

I hooked the X1M to a dummy load and sure enough, when sending a string of letters----it would definitely drop parts of letters at seemingly random times.

Just to be sure it was not related to the transmit / receive delay setting----I tried it from a setting of 1 to 5 seconds all with the same result.

I thought something else might be going on too, and so for the second test I listened to the X1M's signal on my Yaseu FT-900 as I sent CW on 7.028 Mhz into the dummy load.

I received a strong signal on the FT-900 from the X1M for a few minutes---but then the signal would fade intermittently. Sometimes strong---sometimes weak---and then back and forth from strong to weak as I continued to send CW, (and by the way still with randomly missed parts of characters).

Then I hooked it up to a dummy load and an SWR / POWER meter and could see the same thing happening on the power meter when sending a long series of dits. The power would drop way down almost every 20 dits and then came back up.

Again, just to be sure it was not related to the transmit / receive delay setting----I tried it from a setting of 1 to 5 seconds but with the same result.

I am just wondering if anyone else has had any similar experiences---and could possibly suggest some solutions? Thanks! Nathan Volle,KQ9V

Yep, my set does the very same thing. I just hadn't gotten around to testing CW yet other than blipping a straight key a couple times just to see if anything came out.

With the keyer turned on and sending a series of dits at 25 WPM, the power will drop every two seconds or so. It looks cyclic to me. Being a software type originally, that makes me guess it's a bug in the firmware, not the hardware. Not having a schematic or even a block diagram is tough, but I'm guessing they implemented the keyer in the firmware, maybe with interrupts or timing loops.

This is receive audio recorded off a local receiver.

http://www.mmfrancis.com/ES1/X1M_CW_25WPM_dits.wav

Note that the SIDETONE audio from the X1M sounds okay. I tried sending fast dits manually with the keyer in MANUAL mode and I think the same effect is happening.

We may have another major bug. :(

Surely the company , and / or dealers , have a representative that monitors this list , so they can get feedback and resolve some of these issues BEFORE the radios leave the factory , or at least give us the information , such as a schematic and block diagram to help them resolve the issues .

Anyone have a contact point for them other than the sales page ?

Schematics are always hard to get for these off the hop, not sure why. Had and have the same issues at YouKits, usually end up with a block diagram first and then a schematic to follow.

Not sure even if there is one with the kits.

Ed has contact with the company in China, the list is monitored and all suggestions do get where they have too.

Subject: Re: [X1M_QRP-Transceiver] Re: X1M variable power output & keyer problem

Surely the company , and / or dealers , have a representative that monitors this list , so they can get feedback and resolve some of these issues BEFORE the radios leave the factory , or at least give us the information , such as a schematic and block diagram to help them resolve the issues .

Anyone have a contact point for them other than the sales page ?

Charlie , W5COV

Yep, my set does the very same thing. I just hadn't gotten around to testing CW yet other than blipping a straight key a couple times just to see if anything came out.

With the keyer turned on and sending a series of dits at 25 WPM, the power will drop every two seconds or so. It looks cyclic to me. Being a software type originally, that makes me guess it's a bug in the firmware, not the hardware. Not having a schematic or even a block diagram is tough, but I'm guessing they implemented the keyer in the firmware, maybe with interrupts or timing loops.

This is receive audio recorded off a local receiver.

http://www.mmfrancis.com/ES1/X1M_CW_25WPM_dits.wav

Note that the SIDETONE audio from the X1M sounds okay. I tried sending fast dits manually with the keyer in MANUAL mode and I think the same effect is happening.

We may have another major bug. :(

Hi Fred,

Could you post how the adaptor is wired? And maybe throw up some pictures? Is the 'computer' end a DB-9 or USB?

Chris and gang:

What I can tell you is the end marked computer has a small circuit board inside of it with a RS232 chip.

The other end that goes to the radio has 3 wires and they go to (or looks like they go) pins 2,3 and 5

This is a DB9 male to DB9 male adaptor, when used with my cables I can't get it to work for me at all of yet..

Yes it is supposed to Tim, but I cant get it to communicate with HRD, might be because I have to use a gender bender to go from male to female and then to my USB adaptor as well..

Ok - from what I can beep out, Pin 5 of the DB9 is ground, Pin 2 is RXD (data TO radio), and Pin 3 is TXD (data FROM radio). These connect directly to the microcontroller, so they are TTL (0-5v levels), not RS-232).

420. Output Power Problem

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-06-03 00:59:18 UTC
From: comm8442
Topic: 420 Message: 420

I bought a X1M from Ed and it did not have enough power to have my MFJ-929 tune it (required 2 watts). I put it on a Bird 4304a watt meter and it displayed 0.9 watts on 10 meter. Ed worked with me and I sent it back and he sent me a new one. I received the new one and now the same thing... I can't get it to tune. My tuner says "Increase power." Am I doing something wrong??? I put it in CW mode and key and tune... nothing. I go to SSB, talk...loudly... even whistle (yes, I say I am testing beforehand) and still will not tune. My tuner only shows that I am pushing 1.1 watts. Do I have another bad radio or am I doing something wrong? I can't make a contact to save my life! I know someone will ask... I have a Carolina Windom 80 and it works great with my Kenwood. Please help!

Sorry... yes, My bird only goes to 25mhz. It does have the same result on 10m and 6m...

Key it up outside of the filtered bands and let me know what you get.

I just re-tested mine into a dummy load and watt meter.

I have 4.5 watts out on most bands that have filter, 4 watts on 20 meters.

Get outside of the filtered bands and I have 5 watts, transmit on 500khz
have almost 6 watts.

At 29 MHz have about 2 but at 28MHz have 4.5..

Fred and others, sorry for the slow reply I have been out of town.
It seems that Mark KI0PF posted a great procedure for correcting the LSB offset and misalignment of the signals in the passband problem in his post #397 after I had posted.
I had simply gone into the LSB offset menu and dropped the frequency about 300 cycles, but that left the readout problem. I havn't done it yet but Mark's solution looks like it will work OK.
Now on to the hot AD chip problem and should have a pretty good radio.
Got the loud sidetone tamed also with the aid of the board pic on the forum.

Hey all,

I got HRD to work with the x1m tonight. Based on Fred and Tim's pinout information I wired up a USB to TTL converter straight into a DB9 into the x1m. I'm using a cp2102 chipset. So my setup is as follows:

USB TTL -> DB9
Ground ->Pin 5
TX -> Pin 3
RX -> Pin 2

Baudrate is 19200
8n1 standard serial setup

I've read that the cp2012 boards might have their TX and RX pins silk screen reversed. So if it doesn't work for you flip the TX and RX with your USB TTL side and give it a go. I wired mine the way it should have worked and I had to flip mine.

Oh also the address is the 5e of the 718.

Thanks Fred and Tim for the pinout information! So far all I've done with it is to get it to connect and change the frequency. I'll be mapping out which commands are supported over the next few days I hope.

Ok I did a mapping of the commands. I used CI-V test (http://www.plicht.de/ekki/software/civtest.html) to test the published command set of the 718 (http://www.icomcanada.com/products/amateur/ic-718/Amateur_IC-718%20Instruction%20Manual.pdf) while using this guide to guide the details of the commands (http://www.plicht.de/ekki/civ/civ-p41.html).

Mostly it falls down the line as expected -- if you can do it from the front panel you can do it via CI-V commands. I'll write up the complete run down tomorrow but the most interesting thing I ran across is that the s-meter setting returns a value into HRD -- mine reads s4 constantly no matter what band I'm on.

I don't have a good antenna or any other rig to compare it against so right now I can't tell if a) I just have s4 noise floor of sorts or b) it is a red herring reading that reruns but isn't true. I'm leaning towards B although I'd like it to be A. I look forward to hearing other people's experience with the s-meter setting to see if it is real or not.

I'll translate my notes into a detailed post tomorrow if folks are interested in the exact commands it supports at this time.

So in thinking if was using just a straight USB cable with a female DB9 wired it should work with this little converter?

Problem is the USB to DB 9's I am using now already have a prolific chipset in them which is probably why I am getting nothing.

How would this work:

http://www.adafruit.com/products/954#Description
USB to TTL Serial Cable - Debug / Console Cable for Raspberry Pi

It's a 3.3 volt TTL to USB converter. The USB end uses a PL2303HX.A Prolific Serial-USB chip. I can just drop the connectors onto the pins of a DB9.

By the way - 20M USB contact with a club station on PEI from here on Long Island Saturday, with pretty crappy band conditions. Not too shabby.

HRD and its partner, DM780 is a control program for SSB radios that permit computer control. For example, you can set the frequency of the radio, or generally, any parameter that can be set by the front panel of the radio. DM780 is a suite of digital mode programs, such as PSK31, SSTV, etc.

HRD has a nice set of graphics and is generally easy to use.

HRD is especially good, as it connects to a wide variety of radios. The DM780 suite can be run as a "stand alone" program. For example, the Alinco DX-SR8 that is my main radio, is not supported by HRD, but I use DM780 and a soundcard interface (SignaLink USB) for digital modes.

For my Yaesu FT-817ND, I use the complete system for control of the radio and sending digital modes.

Hi George,

HRD for this rig for me mostly means bigger operating controls. The display on the x1m is TINY and the buttons make my fingers cramp as I'm scrolling through freq. HRD allows nice big numbers, easier slider to change freq, and even direct frequency input. Makes it a little nicer to use at home -- now on the road -- tiny controls it is!

Mine seems low on 10m also, about 1.5 watts. All other bands are 4 to 5 watts out. 10m has been kind of dead lately so haven't given it much thought.

Hi Fred,

I'm not 100% sure what you are asking. It sounds like you've got a USB -> Serial (db9) adaptor connected to the computer and are plugging that into the 'factory' cable. I'd expect this to work with the caveat that it sounds like you've got to put a female-female adaptor between the two? Is it possible that adaptor is a cross over adaptor? So it flips pins 2 and 3? I kind of suspect your adaptor is more likely to make it 'not work' than the 2 chipsets. But with that being said -- 2 chipsets could totally bork it up.

Serial connects and pin outs are annoying confusing -- its like 15 standards that all look the same on the outside. GRRR.

Hi Neil,

That should work just fine.

I used this cheapy from ebay last night -- $2.68 + free shipping. Took a little over a week to get here but no problems besides that. Driver installed no problem on windows and automatically recognized in Linux. (http://www.ebay.com/itm/330616868559?ssPageName=STRK:MEWNX:IT&_trksid=p3984.m1439.l2649).

The other thing is if you have a programming cable for any other radio you likely can use that with an adaptor for the x1m. For example -- my wouxun cable is identical to the kenwood PG-4y cable. As you can see here -- (http://www.kenwood.com/i/products/info/amateur/pg4s_4y.html) to make it work with the x1m theoretically all I'd have to do is take the 2.5 mm shield -> pin 5, 2.5mm ring -> pin 3, 3.5 mm sleeve -> pin 2.

Most of these programming cables are a USB -> TTL level converter with the pins in different formats for each manufacturer.

DISCLAIMER/CAUTION -- I haven't tried to convert a pre-fab cable to use with the x1m yet so try at your own risk.

OK -- I uploaded an libreoffice spread sheet with the command set discovery I've done so far. At this time it is a copy of the raw commands from the 718 manual with a simple did it work on the x1m and notes field.

I'm manually running the serial commands and seeing what returns. This should help anyone looking to use hamlib and also let us all know what should and shouldn't work in HRD. For now it is in the raw data state eventually I/someone can repackage it into HRD specific yay/nay.

Be aware that some of the nomenclature isn't obvious -- check the link to the commands to really see what they are doing (read or write? or both?).

There are a few commands the radio accepts and returns values for but I don't see anything changing on the radio. So those are certainly intriguing like the s-meter setting -- do they actually work or are they red herrings?

Oh and the radio returns an address of ALL which means it doesn't matter which ICOM rig you use it should respond to commands it knows. So you don't HAVE to use the 5e designation for the 718 - I believe.

So it is just a method of controlling the radio via computer?
Thanks, Chris.

444. Output Power Problem

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-06-03 20:13:10 UTC
From: Terry
Topic: 420 Message: 444

FWIW, when my radio arrived a couple of weeks ago, it received well but there was no output power CW or SSB, nor did the mic light when keyed.Internal inspections showed nothing obvious & I tried the mic connection fixes with no success & made plans to ship it back. A final quick peek under the covers & still nothing seen.
One last check with the dummy load & bingo, full power(4-6W) out on CW everywhere except 18.1 where it's 3 Watts.
Dale at Kight Radio, who has been most helpful, advises that this has been a problem of the front panel not making good contact & that removing & replacing the front panel has often resolved issue.
This is next on my to do list even thought it continues to function correctly.
And, if anyone is interested, I have measured CW output power at every even Mhz. from 1-30 as well as within each amateur band.
73, Terry, VE7TEB

Hi George,

The nice HRD suit provides direct access to several digital modes (eg PSK, slow scan TV), and also provides control and data to several other interesting and popular digital mode programs such as JT65-HF and the new WSJT-X software.

A 5W rig is just about right for the WSJT modes, as long as it doesn't mind a 30 second full power key-down.

Cheers,

Tony VK2AJF
Castle Hill, Sydney.

That's great Chris,

I never thought about that. I have a cable that I use on my Baofeng UVR3 which is actually for an older RS scanner,and I made an adapter for the 4-cond UV3R jack. I could just make another adapter. I always thought most of these HTs were serial. I need to research this.

Thanks for the info!

Chris,

For this one, explain which pins you used. I'm assuming TXD, RXD, GND.

Thanks!

From: nvolle@sbcglobal.net
Topic: 405 Message: 448

Thanks Mark for the feedback on the keyer and output problem confirming what I am experiencing.

Would it seem likely to you that all of the transceivers are having this same problem?

I am unable to use mine until I get a fix for it. If all the others have the same problem---I don't see how they can be using it for CW. What do you think? Nathan, KQ9V

>
> With the keyer turned on and sending a series of dits at 25 WPM, the power will drop every two seconds or so. It looks cyclic to me. Being a software type originally, that makes me guess it's a bug in the firmware, not the hardware. Not having a schematic or even a block diagram is tough, but I'm guessing they implemented the keyer in the firmware, maybe with interrupts or timing loops.

That's correct Neil!

The pins I used are as follows:

Computer -> Radio
GND -> GND
TX -> RX
RX -> TX

If that doesn't work flip the RX/TX pins.

I'd expect it to work. I know I was able to convert my Wouxun cable into a Kenwood G707 cable this way -- just redirect the pins.

Let us know how it goes!

For my various QRP rigs (Yaesu FT817ND, Norcal 40A, MFJ Cub, etc.), I use a variety of things. For field use, a 5 AH SLA cell. Main QTH use, that SLA "floating" on a charger, or a 3A Samlex with some extra hash filtering, or my aux 7 amp output from my MFJ-4225MV, which powers my 2m/70cm rig.

When I get my X1M (late June, hopefully), I'll likely use the SLA.

I plan on trying to build me a matching power supply for it . Mine should be in the same shipment as yours Paul , and I already have a sketch pad of preliminary drawings for matching accessories that I want to use with mine and look like they were made to go with it .The accessories will take up more room on the bench than the radio :) I also have a12 volt battery plug in the travel trailer if the electric goes off .

If we get the current draw down on receive , I could also go with a SLA "floating" on a small solar panel , for power . Just have to get the radio in hand and take some measurements the way I will use the basic radio . A solar powered system would be nice .

OK, my QRP accessory kit.

SLA gel cell or Samlex 3 amp supply
LDG Z817 or MFJ-901 "Travel Tuner."
Vanco "CB" SWR meter, or QRP kits SWR bridge
Small headphones
Key - American Morse "Portapaddle" or Whiterook key

I fit everything in a "Sportman's Dry Box," like you use for shotgun shell, etc. Has a nice "O" ring dust/moisture seal

I received the radio this week; opened the box to verify contents, then put it back in the box. I just don't have time now to tinker with this radio.

Radio with domestic shipping: $280

Prefer check or cash, but will accept PayPal. Photos on request. QTH is near Boulder, CO; if local pickup+cash will sell for $270.

I may or may not have a problem with the speaker jack.
If I plug a speaker (mono) into the rig I get audio but very low. In fact it is lower than the internal speaker. If the plug is only in part way, so the internal speaker is not cut off, I get all kinds of volume.
Is this not a mono style jack or is this other than an 8 ohm output?
What is your experience?

Bill

It is a stereo jack. I experienced the same thing when you plug it in
partially. I plan on playing around with the stereo jack that came with it
to connect to a mono speaker. I currently have it plugged into an old pair
of amplified stereo speakers from an old computer, they sound great.

Topic: 458 Message: 460

It is a stereo jack. If you want mono operation, use a stereo plug, but don't use the "ring" -- let it float/do not connect.

In general, most QRP rigs are designed to be used with "drugstore" headphones or ear buds.

Topic: 461 Message: 461

Those first two parameters...

I believe the first one is the ratio between the internal clock in the CPU and the bus -- 6x, or 1x.

My bet it that the second parameter is the relationship between the crystal on the CPU and the frequency synthesizer -- if someone has a laboratory quality frequency counter, you could check that out.

Just my 2 cents.

Any more word on the shipment at the end of the month?

Looking ahead, has anyone tried digital modes (PSK-31, etc)?? Looks like you could use a SignaLink USB interface. Audio from back jack, input to mic jack, as well as PPT.

Is the mic plug 3 or 4 connector? I note (I think)in photos of the microphone that there is a provision for an external headphone, such as are used in most of the Chinese HTs. Same style as my speaker microphone for my Wouxuns and Baofengs.

Any insights?

One of these in the appropriate size seems to work fine.

It is a stereo jack. I experienced the same thing when you plug it in partially. I plan on playing around with the stereo jack that came with it to connect to a mono speaker. I currently have it plugged into an old pair of amplified stereo speakers from an old computer, they sound great.

Attached are some pictures in PDF format of the Go-Box I've put together with my X1M. Ready for Field-Day and just general fun. Battery is a 7 Amp Hour battery used to supply a hunter's stealth cam for long periods of time, got it on sale at a Gander Mountain. Powers the X1M for hours. Pair of Sony Noise cancelling headphones that work great. A 40 meter Par End-Fedz antenna and associated cables and adapters, along with a small straight key and single paddle keyer, all fits in an ammo box. Life is great !

Also carry a homemade antenna launcher I threw together with left-over PVC pipe and a $6 reel from Walmart and a $4 slingshot from the same place. Works great ! Get's that 40 meter antenna suspended in no time.

I plan on using either:

1. QRP Kits SOTA tuner.
2. MFJ-902 "Travel" tuner with QRP kits SWR indicator
3. LDG Z817 auto tuner from my FT-817ND system.

OK, here is what I found .....
Letting the ring float, you get output to the speaker, but very low volume. However, there is plenty of drive for a light weight set of stereo head phones. (Resistor in line so you don't blow out your ears?)
Looks like for home a set of amplified speakers may be the trick.

try bridging the tip and ring. This will probably bring the speaker volume up to normal levels.
If you get plenty of drive out of a pair of headphones, then obviously the output is speaker level so a regular external speaker should be producing normal volume.
Dumb question, but this speaker you are using works fine on other output sources right?

regards
Colin

the output of the x1m is a split mono signal...so even though it's mono, the jack on the radio sends half to the ring, and half to the tip. That's why you get audio in both ears of a set of stereo headphones. The audio output isn't stereo itself.
So, when you connect an external speaker, you should tie the tip and ring of a stereo plug together to achieve the appropriate loudness from the speaker.
Otherwise, it'll literally be half the volume it should be.
When you use a mono plug, and pull it out a little bit, the tip is actually shorting against the ring and tip contacts inside the jack and that's why you get the right loudness when you do that.
However, if you use a stereo plug, and leave the ring floating, the speaker is only getting half of the split mono signal.

Rich,

I'm using an Emtech ZM2 QRP tuner. Great little z-match tuner with an SWR indicator LED. That with my random wire in the trees here has been working great. Used it portable a couple of times too with very good results. I've been heard in Florida, Columbia, Venezuela, and this past weekend, Czechoslovakia from Long Island.

Excellent reviews on e-Ham http://www.eham.net/reviews/detail/445

Steve,

Here at home it's just short of 60 feet in the trees. Goes straight out about 35 feet and then turns right for about 25 feet. I have that on a Balun Designs 9:1 unun. The counterpoise is out on the roof/overhang and is only about 12 feet. I find that on some bands it's better without so I have it on an alligator clip for easy disconnect.

Portable it's about 40 feet of wire, and a 25 foot counterpoise. Seems to work fine without the 9:1 in the mix, and I don't always need the cp. 40 feet without a cp, hooked directly to the ZM2 got me the 2 South American contacts.

481. Tuners

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-06-13 13:41:39 UTC
From: ab7kt@att.net
Topic: 464 Message: 481

Yes, I have used the Elecraft auto QRP tuner. It works great. I own at least five auto tuners right now (not counting the internal ones in various radios I own), and have owned dozens of manual tuners.

I would rate the Elecraft QRP auto tuner as being the second best for sure and possibly the best one of all the ones I have owned or used. Not that this has anything to do with the discussion at hand, but the internal tuner in the Elecraft KX3 is without a doubt the best tuner I own: it tunes the fastest, it tunes wire that other tuners balk at, and it tunes those wires to a lower SWR than my other tuners. And again, FWIW, I own two Palstar auto tuners that each cost over $1000 and the tuner in the KX3 tunes the same antenna faster, and to a lower SWR. The internal tuner in the KX3 tunes wires on bands that the Palstar can't. The point of this is that I bet the KX3 internal tuner uses the same or similar technology to the Elecraft external QRP tuner.

With the X1M, I have had some problems using an auto tuner. Even if I "tuned the tuner" with another rig, then hook up the X1M, the tuner wants to re-tune with the X1M. I have a similar problem with an amplifier I have that does auto band switching. I can use the amp with another rig on the same frequency, then switch to the X1M and the amplifier faults. I suspect that the problem is that the X1M puts out a dirty signal (at least on the bands without a filter network) and the auto tuner or the amp can't decide what frequency to tune for. But this is just a guess: I never hooked the radio up to any test gear to look at the signal. As an example, I can tune my wire antenna using the Palstar AT-Auto tuner when using an Elecraft K1. The tuner senses the frequency, and tunes to a nice match. I throw a switch and replace the K1 with the X1M on the same frequency and the tuner starts retuning: and this re-tuning is drastic, not just a touch up. Suggesting to me that the tuner is sensing a frequency far removed from where I want to be transmitting. My solution to this is to "tune the tuner" using another rig to the frequency near where I plan on operating the X1M, then switching the auto tuner out of auto mode and into manual mode so it doesn't retune itself. This isn't an option with the amplifier: I simply can't use the amplifier with the X1M: it just faults every time I transmit.

Several of us have noted that the X1M is putting out spurious emissions when used outside of the filtered areas. The strongest spur seems to be about 9Mhz above the selected frequency. Read back through the earlier posts for this info.

As an example, my X1M tunes up differently on 7151 than it does on 7149, and definitely is putting out some noise on the former too.

Hi Neil,

TNX for chiming in on this subject. I believe the bandpass filters are switched out at 3.9 MHz and 7.15 by the microprocessor. Why they decided to do this and not at the end of the bands, I don't know. I emailed Kightradio about one and a half weeks ago on this subject and when we are going to get a schematic, and have received no response. I noticed that several hams have got their X1Ms up for sale is this why? At any rate I'm working on an outboard filter to alleviate this problem. I don't know about the rest of you but I'm getting a little frustrated.

Suggesting to me that the tuner is sensing a frequency far removed from where I want to be transmitting. My solution to this is to "tune the tuner" using another rig to the frequency near where I plan on operating the X1M, then switching the auto tuner out of auto mode and into manual mode so it doesn't retune itself. This isn't an option with the amplifier: I simply can't use the amplifier with the X1M: it just faults every time I transmit.

Good luck trying to get a return email from Kightradio. I'm still waiting
for them to get back to me from three months ago. That's why I bought my
X1M from importcommunications.com.

Hi Mark,
When I bought my X1M 2 months ago I thought Kightradio was the only game in town. When I bought my IC706 I got the schematic with it.

I built 2 bandpass filters and I've just got to get over to my friend's house and use his Spectrum Analyzer.

It's a pretty good little Radio, unfortunately you don't get all of the 80 and 40 meter band or any of the WARC bands.The only thing that comes close to those 80 and 40 cut-offs is region 3.

So far I have not heard much about this radio to maintain a desire to buy one. It appears they are close to having a winner but quality control and odd operating parameters along with a dirty transmitter make this a big initial failure in the market. Yes I know they have sold all they had, but the reality of the products market reception, once people have actually used it, has not been a good one.
Such a shame that something so desirable has so many issues. They may resolve some of these issues eventually, but the poor folks that already spent their money have been given a poor quality piece of gear (in my opinion).
I have heard that new software is in the works (Lets hope so) so we shall see what improvements/corrections are made.

Several of us have noted that the X1M is putting out spurious emissions when used outside of the filtered areas. The strongest spur seems to be about 9Mhz above the selected frequency. Read back through the earlier posts for this info.

As an example, my X1M tunes up differently on 7151 than it does on 7149, and definitely is putting out some noise on the former too.

Hi Ken
I have talked about this radio to some of my ham friends and it seems to be the consensus that the X1M is a seed money radio to pay for the 20 watt version coming out later this year. Unfortunately (IMO) nothing will be done about this radio. There has been no assurance from either of those resellers that these problems will be resolved.
I guess I should have save my money for a FT-817.

ITU Region determines band segments. Every ham should know that the upper edge of the 40m band is different depending which region you are in.

For much of the world. 40 meters ends at 7150. Hence cutoff at that point when designed in china for Chinese ham use.

You are applying a usa perspective to a product not necessarily designs for the usa market. Or, the local designers are applying their perspective to the product design for their market without thoughts of it being exported etc ... - local vs global

Joe. BY1/K7JOE.

Gary,

It's set up for the Chinese market. The 3900 cut-off makes sense in that case, but the 7150 cut-off does not. I'm not sure of the exact upper band limit for China as I've read conflicting info stating both 7200 and 7300. One is here:

http://files.radioscanner.ru/bands/files/document76/castoti_kitaa_2005.pdf

As I've said before, I still like the little radio, and if they can offer a modification to stretch and/or add bandpass filters I'll be liking it even more. I don't operate CW, so that might be why I'm OK with it for now. Some of the posts here have spoken about major issues with using the radio for CW.

As far as Kight Radio, you are not the first person that has said that, however Dale always responds promptly to me. I get the feeling that his email is not all that reliable. Not sure what to do there. Both he and Ed from Import Communications monitor this group though.

It looks like Ed uploaded a schematic this morning!

Very interesting design. For digital modes, having the choke in the ground side of the microphone might pose a problem?

Also, it would then appear that the microphone is a repurposed speaker mic? In the photos, there does appear to be a fitting for an ear bud/plug on the microphone next to the cord? No audio feed to it then.

Other observations?

Most enlightening! Cool design! I am eagerly awaiting the delivery of mine in the coming batch!

I would agree that this has been designed for the world market. I think we can live without the extra band limits on some of the bands, especially for CW operation.

20 watts is a very different category than 5! Maybe fits the niche of the old Icom 7??+ at 10 watts?

>Unfortunately (IMO) nothing
> will be done about this radio. There has been no assurance from either
> of those resellers that these problems will be resolved.

Not my perception from reading Ed's comments. If the QC issues are addressed, and the power output/series of dits are addressed, it should solve 99% of my concerns. The LSB issue sounds like a 15 minute project, at worst.

> I guess I should have save my money for a FT-817.

They are very different radios! I used my FT-817ND as a base state for a number of years, but the small QRP rigs (MFJ, NorCal, QRPKits, etc.) are a lot more fun for general "tinkering," and light field radios.

Hi Charlie,

Well my maximum output is 4 watts on 80 CW And zero on 10 meters. I could turn it back in but I'd probably get one that's the same way like you did. I've got the schematic but because I can't hear the relays close it might be the firmware.
Kightradio won't answer my emails or answer their phone.

I'm really happy with the MTM brand of 50-cal ammo boxes. Strong, light, sealed with an O-ring - they seem to be the best of their kind. I have been buying them at work for our field engineers to carry tools and parts - everyone seem to like them. I was buying them for $12 - $14 each a few months ago but I see today that they are running $17 - must be selling well.

http://www.amazon.com/MTM-Forest-Green-Caliber-Storage/dp/B003TNV46O/ref=sr_1_4?s=sporting-goods&ie=UTF8&qid=1371399490

I also see that Gander Mountain has a somewhat smaller version they are calling a 45-cal ammo box (aka "sportsman dry box") for $10.

http://www.gandermountain.com/modperl/product/details.cgi?pdesc=Crow-Shooting-MTM-45-Cal-Ammo&i=726645

Hi Gary , I wasn't the author of the power problem , only the question about the dummy load and power on the filtered bands . My radio is on order with the batch that is shipping this month so I have yet to get my hands on one of them .

Check the circuit diagram recently posted. The unused wire is likely the speaker.

Don't have it in front of me, but it is in the files section.

Mine broke off too.? The black wire is ground, and the white wire is the unused speaker line.? Of the remaining two, one is mic and the other is PTT.? If memory serves red was PTT and blue was MIC, but I'm not certain of that. You can put an ohmmeter from each one to ground as you press the push to talk button - the one that goes to nearly zero ohms with the button in is the PTT.? And the remaining wire is the MIC.?

The connector tip is PTT, the ring is MIC, and the sleeve is ground.

Once I confirmed that my reconnection was a success I superglued the plastic cover and strain relief to both connector and cable jacket to hopefully prevent

Try filling the plug with RTV silicon caulk/rubber. It is less permanent than super glue, and can be removed later, if need be. It acts as a "potting" compound, and keeps the wires from moving about. We used to use it in the electronics industry a lot.

Truthfully, the PL-259 is a more rugged connector. Does WIMO sell to the US -- in particular, the computer interface cable? Wouxun US does not list it at this point. My X1M is still on order from Wouxun US.

I figured it out based on your knowing black was ground. Thanks....I reconnected and get a very bad hum on key up now....Its going in a box and being shipped back on Friday when I get paid. The CW ground does not work anyway and the CW sounds like garbage. Hopefully the replacement will be better?

Personally I like to go with RCA connectors. Smaller, more packable for Field Ops. And connect and disconnect easy when someone trips over your antenna or coax, or your buddies Dog runs through your set-up. Thus your antenna may go for a ride but not your radio itself. (True story, happens with my end fed wires all the time)

Long ago, and far away, I worked for RCA's Sarnoff Labs in Princeton, NJ. We used the RCA connector for no end of stuff. The metal shell version is best, and I've used it all the way through 2 meters with no problem.

Note that the MFJ "Cub" transceivers are fitted with an RCA jack. I do admit to making an RCA to PL-259 jumper, and adding the optional BNC jack, just for completeness and compatibility with my other gear.

Considering the angle the plug comes out at (I don't have my X1M yet), I would consider fitting it with a right angle stereo plug instead of the straight one. Rat Shack?

They have a discount now, it's down at 269 for the unassembled version.

They ship outside EU, you will also get it cheaper since you won't pay the VAT (wich is 19%).

I'll be getting one as well if I won't find one before they bring it in stock.

I have an X1M that I bought at Dayton this year. I don't know if there are variations or different models..... Mine has a BNC connector for the antenna. As far as I know, everything works just like it came from the factory. Comes with the mic that came with it. I have made a few contacts on it using both SSB and CW.

I am sure all of you with radios on order got an amazing letter from Ed. It gives the concept of "Chinese English" a whole new meaning. I am going to keep my order. This is much too much fun to watch!

I suspect we are not on the "cutting edge" as much as on the "bleeding edge." <grin>

Three cheers for Ed! I am quite sure this will work out well.

It is interesting to follow this project. The Chinese, in my opinion, as doing what the Japanese did -- copy, then start to innovate. Consider the Wouxun and Baofeng radios. Re-purposed commercial equipment, it would appear. Disclaimer -- I own two Wouxuns and three Baofeng HTs. Just replaced a battery on one of the Wouxuns after about 2 1/2 years of very heavy use.

I agree with you Paul, and as with this project and my dealings with YouKits, I can confirm Q/C is one of the biggest issues at hand, and then it is replacement and warranties..

The stuff out of China is getting much better in my opinion, but still quite a way to go to be an Elecraft or TenTec product.

It is easy to scoff at this gear, but without input both positive and negative it is hard to make changes.

Not only that the language barrier is also a huge issue when explaining our concerns and needs.

Fred

I am willing to wait for the radio also . I look forward to working with it . It appears to be an excellent opportunity to work with developing a radio that will in the end be a very nice radio aided by the input of all of us that like to tinker and build.

I do wish that it was more of an open source , open platform , type of device . There are a lot of hams that could really be of benefit to the company too , in their ability to troubleshoot , make revisions and modifications that could be implemented to make it a better radio for everyone involved .

I just bought me a Baofeng dual band HT last week to take on a trip to a family reunion out of state . I haven't been on FM in at least 2 or 3 years and for the price I think it was a great buy , especially given my lack of participation in talking on FM , plus it is a handy little scanner .

Charlie , W5COV

As a a result of a family medical issue my radio is also for sale.

It's from a late shipment & has the BNC antenna connector. Powers up nicely on the dummy load, never used on air.

The radio is located in Canada (GST & PST already paid) & is available for $275 USD shipped to Canada or USA.

531. Power measurements

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-07-03 04:56:47 UTC
From: gordymurrieta
Topic: 531 Message: 531

Using Elecraft DL1 dummy load with diode detector and whistling into the microphone I measured the output volts with a multimeter. Calculate output watts using formula:

P(watts)=((V(volts)x1.414)+0.15))2 /50

10m at 9.5 volts = 3.5 watts
12m at 10.5 volts ~ 4.5 watts
15m at 9.5 volts ~ 3.5 watts
17m at 11 volts = 5 watts
20m at 9 volts = 3.3 watts
40m at 12 volts ~ 5.5 watts
80m at 9.8 volts ~ 3.7 watts
160m at 13 volts ~ 6 watts

On 40m at what frequency did you do the test ? Over or below 7.150 ?

17m and 12m is higher because it includes the +9MHz spur, as the outputs are unfiltered.

What was the power supply voltage ?

Measured with Bird 43, 50 watt slug, 50 ohm load
Here are my measurements:

Frequency output +9 MHz spur

3.500 4 0
3.900 3 0
3.901 4 3
7.000 3 0
7.150 3 0
7.151 4 3
10.101 3.9 3
14.001 2.1 0
18.070 4.1 3.9
18.120 4.1 3.9
21.000 1 0
21.450 3 0
24.890 .5 0
28.000 0 0
28.500 0 0
29.000 0 0

The people at Kight Radio assure me that when the new region 2 X1M radios come in I can exchange this one.

536. X1M - latest version - the "lowdown"

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-07-04 03:04:16 UTC
From: pezcat19
Topic: 536 Message: 536

Hi all,

I am very keen on getting a new X1M. I do a lot of SSB QRP work with an FT817 which is great fun. I do not need an X1M, but it looks like a great concept a bit of cheap fun, so I want one! ;)

I am in Australia, so I guess importing one is the only option for me? (from Knightradio or ImportCommunications I guess?)

Can someone please give me the "lowdown" on the following please?

- Are they still on 'backorder' from the factory?

- Are all the new version (2.02? I think?) improved over the first run?

- What is the biggest issues with the latest versions? (Such as the LSB problem - is it resolved now?)

- Does the latest version have the SO-239 connector? (I hope so, because BNC is NOT as useful for me - especially with a Miracle Antenna!

Thanks for your help,

Pez

And I have just seen on the blog http://blog.sina.com.cn/bg8ht this:

"X1M Platinum Edition [V3.01b] will be formally listed...

X1M Platinum Edition [V3.01b] will be officially listed, is currently in mass production. Which X1M for custom models to optimize the part of the circuit to accommodate the relevant EU regulations. Screen with OLED screen, buttons for the silicone keys."

This does not appear to be an X1MKii (as seen on the internet). Is the original X1M going to be gone/out of date before it even really arrived? Replaced with a new "Platinum Edition" perhaps???

I wonder what the "relevant EU regulations" are? Just RoHS perhaps?

I am interested in the the groups thoughts on all of this.

Pez

Here is more info on the "Platinum Edition"

http://www.brickolore.com/2013/06/xiegu-x1m-platinum-edition.html

And check this out! lol :

http://v.youku.com/v_show/id_XNTcyMzcwMTgw.html

The way I see it, there is 3 versions of the X1M in development.

1 - The X1M
2 - The X1M Platinum Edition
3 - The X1MKii (see: http://www.brickolore.com/2013/03/xiegu-x1m-x1mkii.html)

Is there any more?

I hope they can focus on getting at least one of these radio's working right, and to market at the right price. The world would be a better place with a QRP radio offering like these, at the right price!

Pez,

I'm also in Australia, and somewhat interested in this radio.
I have an FT857, and would like a FT817 for portability, but can't justify the price.

I am a bit concerned about the output power in recent posts, which I hope they rectify.

I believe the MKII is supposed to be 20W and alot more expensive.
I'm not to worried about the extra 15W (maybe 10w PEP would be okay), as >99% (probably more) I only use my radios as receivers.

Rob.

I'm surprised on how strong the +9MHz spur is; I thought only the lowpass filters are bypassed when out of the supported bands, but it seems it is bypassing the bandpass filters as well (probably the filters are too narrow anyway). Wich makes me wonder wether the X1M works at all outside the supported bands, as there is no image frequency rejection.

I thought about a quick fix by using a separate Arduino Mini controller for the filters, connected internally on CAT to pick up the working frequency ... since the manufacturer won't probably fix this via firmware.

Hi Rob.

Thanks for the reply.

The power output problem is a concern of mine also.

I like the idea of the X1M for the reason that is SO simple and CHEAP. No 'bells and whistles', it will not be 'as good' as my FT817, but it should be simple, cheap and fun!

I am very happy with 5W max (in fact, I rarely operate with more than 5W!), but if there is a problem with the X1M that means significantly lower than 5W (especially on 10m where I operate the most) then that's a problem for me...

Like you, I don't need 20W. (I wonder how much battery power it will need to run at 20W?) It is all about the small size and low cost for me. If the original X1M has its few problems resolved then the price and size is just right. I would be unlikely to purchase an X1MKii if it becomes expensive - because I already have an FT817 which is brilliant! If it is cheap, then I wont be able to help myself! hihi

Cheers,

Pez

If the X1M MkII comes to fruition you will see a big $$$ value placed on it, and probably in no time soon.

I think ironing bugs out of the X1M will be and should be priority for the maker if they wish to hold onto a North American Market.

With all of our choices here in North America a product like that made in China needs very strict q/c guidelines and need to have a real good return or repair policy that won't kill the dealer in North America. The dealer in North America is only the messenger so please do not shoot him..

Language barriers and letting them or trying to show them what we need here is a challenge indeed.

See what happened sown the road, but still for $ value it is a cool rig, the power issues are still way better than when I beta tested this rig last August.

Hi Fred,

Thanks for the reply (and for the info you have already shared in the group - very helpful!)

I agree with all of your comments. I will keep looking for a new review of the latest batch of X1M, and if it performs well, or even "just better" than it does now, I will be placing an order then.

I hope this happens soon because I want one now! hihi

Hi guys,

U am still waiting for mine, too. But they did answer my last couple of emails and offered me a refund if I wanted it. I chose to wait a little longer, even though it has been far too long already. (I did a pre-paid order months ago.)

There is a line of small print on their website right now that reads as follows:

KR-10 QRP SSB/CW Transceiver
>Assembled
>
>
>6/26. Delay from Mfg. new modified units are delayed. We expected shipment by now. They informed us it will be another couple weeks. We will keep you informed.

You can read it for yourself here:

http://www.kightradio.com/Chinese-X1M-QRP-HF-SSB-CW-Transceiver_p_305.html

I ordered mine from Import Communications when they started taking orders after Dayton . I still am waiting like everyone else to see it yet . No updates as to when to expect them to ship now . Originally it was supposed to be mid June , then later the first of July . I have no idea when to expect shipment and what changes (if any) have been made from the first group and the one I am waiting on .

Has ANYONE received one that was ORDERED from EITHER of the companies ??

Updates would sure improve customer relations ....

I find this interesting on the KIGHT RADIO description of the radio :

Main Features..........

Chongqing Xiegu Technology Co. Ltd - Manufacturer
Import Communications - North American Distributor
Systems Menu

.....etc.

Hi,

I am on my second return radio and I have no output on 10 meters on this one. I was assured by the people at Kight Radio when the new X1Ms come in I can exchange this one for a new one. I was informed that new radios will have a new type front panel and set up for region 2. The first radios were setup for region 1.

Hi Andy,

I have an X1M on order from Import Communications, and I am awaiting the new stock to arrive like the rest of us.

From the small amount of information available, I "think" (and hope) we might be getting the "X1M Platinum Edition" in this batch. As Gary mentioned that allegedly includes a new LCD screen, region 2 banding and various unknown "improvements".

http://www.brickolore.com/2013/06/xiegu-x1m-platinum-edition.html

And: http://v.youku.com/v_show/id_XNTcyMzcwMTgw.html

It is a lucky dip and I don't know for sure what we are getting, but either way I am excited to see what arrives! I live in Australia so hopefully the postage to me will be fast! :)

It is quite amazing how little information there is regarding this rig coming from the manufactures (basically none at all). This must be a nightmare for the distributors (such as Import Communications) to deal with. Credit to Ed for sticking with it! Considering how popular this rig seems to be and the interest it is quickly gathering, the manufacturer is missing out on a huge market by not "sharing". This assumes they have the capacity to meet demand, of course.

I can't wait for the updates when they come, and I cant wait to get my new X1M!

Regards,

Pez

Just mailed Wimo in Germany where I pre-ordered my X1M.
They have just updated their website to announce the delay in delivery. Instead of getting their first order midst of July they will get it now in the beginning of August. The first order is already sold-out.

I redid the test within the filtered bands. Power is a 12 volt Power Sonic sealed acid battery, model PS-1229, 2.9 a/h. Two batteries joined so ~ 7 a/h.

By the formula P(watts)=((V(volts)x1.414)+0.15))2 /50. So 11 volts = 5 watts, 9 volts = 3.3 watts, and 8.8 volts = 3 watts

Band 2:

LSB 07.000.000 MHZ = 9 volts

comment:
Odd thing with using the DL1 dummy load. For LSB, loud whistling for 5 seconds only showed 3 volts. Loud sustained voice got it to 9 volts. Opposite is true for USB, loud whistling showed better power results.

Band 3:

USB 14.000.000 and 14.400.000 MHZ = 8.8 volts

Band 4:

USB 21.000.000 and 21.300.000 MHZ = 9.2 volts

USB 28.000.000 MHZ = 8.6 volts

USB 28.500.000 MHZ = 9.2 volts

comments:
The radio started to make a high pitch noise after awhile. Maybe this is due to the component that allegedly needs a heat sink.
Measurements were at peak readings for sustained loud whistling for 5 seconds except for 40m where LSB showed better results with loud voice. I'll need to build my WM-2 wattmeter to compare results. Current results say the radio cannot do 4 watts on the filtered bands.

Not sure what people are finding acceptable to live with. When is the radio too out of spec?

Hi Gordy,

I don't have a unit <yet>, but wouldn't be better to either use the CW mode, or feed in a fixed level audio signal to the microphone? This would make your measurements more repeatable... I know my whistle gets weak after a while!!! You could probably use a PC sound card (headphone/speaker output) to generate it... I'm sure there are lots of freeware tone generation software out there.

Thanks for the work.

Isn't there a two tone test where you use two tones that are NOT
harmonically related. My old ARRL Handbooks show this and what it should
look like on an Oscilloscope.

I turned off the automatic keyer so CW gives a steady tone. I kept measuring with the multimeter until the display stopped climbing.

Results for CW mode with steady tone:

28.000.000 MHZ = 9.86 volts
21.000.000 MHZ = 9.19 volts
14.000.000 MHZ = 8.9 volts
07.000.000 MHZ = 9.4 volts

So a little better but still not 4 watts which would show around 10.10 volts.

The sealed lead/acid battery measured 12.34 volts with the voltmeter directly.

From: W3FIS
Topic: 562 Message: 562

Anybody try digital modes on the X1M (mine is on order, looking ahead?

Since HRD will apparently interface with the X1M, I am thinking of hooking up a spare SignaLink USB interface I have -- a RJ-45 cable with one end cut off, and connected to a pair of stereo plugs - one for audio input/PTT, the other for audio out from the back headphone jack. Might need a couple of ferrite chokes and some heat shrink tube to make a neat job of it.

Any thoughts or experiences??

It was pretty vague. Mostly about greater stability. Your guess is as good as mine.

I think the mfg. has all the dope from Ed concerning problems that all who have the radio encountered. I held off on my order until it appeared that I would (fingers crossed) get one out of this new batch.

The power/keying problems, and the band setting for a different region were ones I would have to see fixed. The SSB BFO setting is one you can do yourself, of course. Ditto for marginal soldering in the microphone plug -- I'll check that out anyways, and pot it with RTV silicon rubber, in any event.

I just stated that I had not received an e-mail from Ed about the subject of this thread (UPGRADED RADIO) or an e-mail about fixes he may have in the works. I find Ed very responsive to any e-mail I have personally sent him and I believe that he will do whatever is in his power to try and rectify problems with the first radios. Buying the first of anything is a risk whether it is a new car, computer or anything else. I have spent a lot more money and had less satisfaction/fun with other hobby (radio and other) items than this neat little radio.

Like others, I will be patient and see what happens.

567. Bandpass Filters

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-07-11 01:30:21 UTC
From: ka8wtk
Topic: 567 Message: 567

WARNING - Novice QRP Op Ahead!

I purchased a bandpass filter from Kis and Parts (quite reasonable) for 17 meters. It appears that it has knocked out the +9 MHz signal on USB when on 17 meters.
Now, I don't own a spectrum analyzer to check this with. What I noticed before the filter was a "carrier" when keying USB with no modulation on an oscilloscope that I use to monitor my AM station. With the filter, the "carrier" no longer seems to be there to the limit of my scope sensitivity. I have the filter tuned for a 1.1:1 SWR on both input and output sides in the center of the band using an MFJ antenna tuner and a dummy load. Band edges rise to 1.2:1 or abouts. I don't notice any real loss in receive sensitivity, but have no way to measure what the insertion loss may be. Also, being new to QRP, I don't have a watt meter that is reliable at this low a power to try and measure transmitted loss or actual transmitter power at 18 MHz.
Has anyone else tried this appraoch or used filters from Kits and Parts?

Bill KA8WTK

568. Re: Bandpass Filters

I'm intrigued at this idea. I don't see any specs about power through the K&P filters. I'm assuming that they can handle 5 Watts OK without smoking if it's working for you.

I'm tempted to order one of the DUAL BP models set up for 40 and 17, and then possibly another for 30 and 12 if this method works.

Unless of course the revised model is something I can swap out my early X1M for. I have tried emailing Dale from Kight Radio, which usually gets a response, but not this time. I would gladly pay an exchange fee, as I know the perils of being an early adopter.

570. X1M Platinum Edition! - More details and pictures!

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-07-13 06:49:29 UTC
From: pezcat19
Topic: 570 Message: 570

Wow! Check out the X1M Platinum Edition!!!!! The rig looks brilliant in my opinion!

Use Google translate to get the page in English (almost):

http://www.hellocq.net/forum/read.php?tid=318494

Translates as:

==========

X1M Platinum Edition (Overseas customized), is in the country X1M version, based on the appearance of the display, buttons, part of the circuit is optimized for a version, mainly to comply with EU mandatory technical requirements of relevant laws and regulations, as well as relevant FCC requirements.
Areas for improvement in this version is as follows:

1 and replace it with a new type of chip, reducing the impact of NC part of the receiver;
2, for a solid OLED screen, to meet the sun observation, as well as the use of cold regions;
3, the replacement of the button, to improve the touch feel;
4, significantly reducing the use of plug-ins that will replace most of the capacitor chip capacitors;
5, will be replaced by a capacitor LPF section COG chip capacitors, filter characteristics significantly improved;
6, the power amplifier section redesigned, converted to all-MOS amplifier, all using Mitsubishi RF power transistors, high gain RF specifications can be protected, each section were 4.5W maximum power over part of the band reaches 6.5W;
7, the control software has been rewritten and revised the CW portion of the bug, is zoned separation standards;
8, on the machine were the focus of EMC rectification, effectively inhibited the machine's various crosstalk;
9, to meet the requirements of domestic and foreign regulations and inspection machines, in software, on the amateur band emission bands made shield (available in the Project menu to open);
10, in order to increase the reliability of keys, key board uses a PCB gold plating.

To meet the needs of my friends and thank you for your continued support and concern that this X1M Platinum Edition Domestic sales are as follows:
Price: 1180 yuan / Taiwan (only mainland China and Hong Kong, Macao and Taiwan)
Complete set includes:
Host a microphone in hand a power plug a
3.5 key plug

Platinum Edition of the machine with the domestic version of the same quality.

Platinum Edition machine standby current of about 450mA maximum emission current of 1.7A or so.

At 12V voltage supply, Platinum Edition Maximum output power at high frequencies around 4W, 5W around in the low frequency band. When the voltage is 13V when the upgrade, which can basically full power output. To reduce the heat, it is recommended to control the supply voltage 12.5V.

==========

I hope that this is what we will be getting in the latest orders. The RX standby current is still quoted at 450mA MAX, however I can live with this.

This new rig looks awesome!

Well I hope I didn't waste your time Andy :/ There is a fair bit of new information there.

Ed from Import Communications has told me that he received information from the manufacturer, stating that the delay for the new batch was caused (partly) because of some of the requested improvements that were being implemented, AND that a new LCD screen was being introduced.

Ed does not have any further information. I am fine with this as he is in a very difficult situation with the "communication barriers" that exist.

I am only joining the dots, but THIS looks like our radio, and I hope it is.

Didn't want to spoil the party, Perrin ;-)
As told before, I have asked Wimo in Germany, too.
The lack on information is really annoying.
You have to order something that may turn to something completely different when it arrives. Hope they will implement better lowpass filters.

So, which version will we be getting? Frankly, I like the retention of the PL-259 connector system -- much more rugged than BNCs.

BTW, how does Ed ship? I will be traveling at the end of next week, and likely will have to have a neighbor watch out for a package, assuming shipping will take place soon.

Hi Paul,

I don't have any "facts" for you, just information that I am reading from the manufacturer, that is lining up with the small amount of info that Ed has been given...

I really hope we get the PL-259 (SO-239) connector also. The X1M Platinum Edition appears to have this connector.

I don't know what shipping method Ed uses, but I hope its fast! :)

OK, it seems I may have found a way to get an idea of the insertion loss of the Kits and Parts bandpass filter for 17 meters.
Using an IC-730 with RF output turned way down, dummy load and my modulation scope there appears to be about a 3 db loss of transmit signal.
Now, this is a kit, and while I have built modern kits before with toroids (several SoftRock receivers, yes they work) I may have screwed up in the assembly or winding the toroids. But if I did, I can't find the error. I need to contact the supplier for hints and I may just order the low pass filter kit (also very reasonable) and see what happens with it.
As a cross check to my findings, I am contacting a local QRP OP with way more experience than I have to try the same sort of experiments with his equipment. As I said before, I don't have a watt meter I trust at this low power level to be accurate.
I will share what I find when I have more information.

Remember when you wind a toroid, you count the inside turns. Not the outside turns, or you'll be off by one. 73

For QRP level power measurements, I have a 52 ohm resistor in a box with a UHF connector. I then pick up a signal from it with a diode, feed into a small capacitor, and measure the resulting DC. That is the PEAK value, so V^2/100 does the trick.

585. X1M a sad story

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-07-17 07:30:11 UTC
From: steve sharp
Topic: 585 Message: 585

Back in March I purchased an X1M from Kight radio, the unit arrived from China pretty quickly.

It only took a few hours with it to discover that the AF was way to low, a 30+ station required the volume on full to just barely be audible over the ambient noise in the shack and the RF out varied from none to intermittent.

I contacted Kight and obtained a RMA (RMA8) and airmailed the radio back for a warranty replacement or repair in early April.

Well by the start of June I was concerned that I had heard nothing concrete back from the them, so gave them a call on the phone from Australia - not sure with whom I spoke, but they assured me that I would have a replacement on the way around the 21st June.

Well here we are on July 17th and I have no X1M or any idea when I'm going to get one.

My emails are not being responded to.

So, have I done my dough or is Kight just pretty slack in the customer support area?

Hi Steve.

Sorry to hear that. We know 'generally' what the manufacturing delays are due to (a new design), however the lack of response you have had from KightRadio is disappointing. I have an X1M on order from Import Communications and I have had reasonable communication from them, and I am comfortable with the wait... Hopefully there will be some good news and updates shortly.

I understand that the the distributors are not receiving much (or any) information, so it is a waiting game a the moment.

I have found out most if my information by reading the blog and Chinese forums where the manufacturer documents their progress. Based on this, I would say you are in the same waiting list as me, and this is most likely that we are waiting to receive the new X1M Platinum Edition. It should be shipping VERY soon based on the Chinese blogs. See the last few topics in the forum for info on this.

So don't give up - hang in there I say. It is just a shame that the communication from KightRadio seems to be so poor.

Good Luck!

Perrin VK3XPT

When I decided to purchase an X1M, I emailed Kight several times and no response. I tried the two phone numbers and no response. From what others on this forum have said this is typical. I purchased mine from Ed at Importcommunications.com and could not be happier. Ed responded to my emails and his customer support has been excellent.

Hello Steve,

Guess I'll go ahead and speak up. I'm kinda in the same boat here as you. I ordered an X1M from Dale in April partly due to his quick e-mail correspondences. It arrived here May 18th, but was DOA. After some more emails and a thumbs up to open up the radio, I found a pin had gotten bent between the face and one of the main boards of the radio. Taking advantage of the warrantee, I wend ahead and sent the radio back to Dale (RMA #12). My last message from him was from May 28, confirming the radio had arrived at his place. Since then I have e-mailed twice conventionally and twice through the customer portal of his website. No responses from any of the attempts.

Still though, I'll say be patient. The day I sent my radio back in, Dale's hometown of Moore Oklahoma was hit by a major tornado. His family and place were okay, but I've given him a pass for not corresponding because of this.

Hopefully we will get a radio from the new batch that's coming out. When my radio came in May, it was actually shipped from Ed at Import Communications. SO I think Ed may be acting as a distributor for Dale(or at least did in May). If I don't see a radio or hear anything after the next batch of radios goes out, then he will be my next point of contact. All in all though, I'm going to keep patient. At least you spoke to someone in June, so that sounds good. I do wish Dale would speak up though and let us know what's going on. Maybe Ed could add some insight?

Take care & good luck,
John Golub

From: John Golub
Topic: 585 Message: 590

Hello Mark,

From what I understand, Dale is the person going to China and dealing with the company. Ed does seem to be the distributor. Both have separate websites, but I think both are working together in regards to the supply chain. Please correct me if I'm wrong.

73,
John
KC8JZO

P.S. In my original post, I forgot to mention that Dale did put up a blurb on his X1A page stating the next shipment of radios would be late. This was as of June 26. I'm going to be patient and wait to see what happens before I jump to any conclusions. Despite the lack of communication after May 28, I have no reason to believe there's been any wrongdoing. It would be nice though if someone from either side could chime in.

These are "re-purposed" speaker mics, such as are used on the Chinese HTs. The 4th wire is connected to the un-used headphone jack. Sleeve is ground, of course. Use your ohm meter to see which give a closure to ground when the PTT button is activated. The other will be the microphone line.

I think this issue was discussed when people were having problems with the QC on the soldering in the microphone plug. Search the messages for that issue.

Guys,
I contacted Dale through the Kightradio.com web site and got an answer back in two days this time. (My previous query a few days before went unanswered.)

Dale apologized for the delays and offered me a refund if I wanted it. I told him thanks, but I would wait a bit longer and see how the revised radios looked like.

I remember also that there was some kind of refund guarantee, like having the money in escrow (although that wasn't how they described it). There is some separate company holding the money until the product is delivered. So I would be really surprised if any customer lost out on this deal. I looked for that email but I couldn't find it under Kightradio. But I definitely received such an assurance in an email. So don't get too despondent. I should think Kightradio or the other importers are the ones sweating more than you and me... They have much more to lose than $300.

Cheers es 73,

David, VK2DMH

Y'all &c,

After I gave the dog its first run with the sheep I realized that this was gonna be my learning moment. Then, as time went on I kept thinking "Put it in another box, wired up the way you like it, put a tiny fan on the VFO IC, put a Z-match in the box with it & then figure you'd built the radio." Then I took my meds & became less delusional.

So now there's a possibility of exchange/repair/swap whatever?

Don't see how that's cost effective to anybody, let alone manufacturer or vendor. Sure be nice but I live in a somewhat less delusional world than most folks on a variety of meme levels.

If and/or when I can say "Here's mine. Gimme one what works," I ain't holdin' my breath.

And it ain't Ed or Import Comm I'm carpin' about. It's just the absolute shallow depth of engineering went into the X1M I have in a box in the closet. To make it clearer: it's the manufacturer's role.

Now I gotta mow a lawn & build a door on a shed. That stuff I can grok easy bigtime.

Absolutely right on that one Nils, that is why testing was done on the first unit back in 2012.. I have all kinds of video and audio clips that was sent with some of the issues..I listed both PROS and CONS of the radio and what would be nice to have or should have been changed. The first unit had terrible power output across the band, some of the ham bands had next to nothing and move out of band a bit and 5 watts.

Time will tell, and time will make or break the manufacturer as will any quality control issues.

Hi all,

As most of you will now know, it has now been confirmed that we who are waiting for an X1M will be receiving the X1M Platinum Edition instead (this is great news in my opinion).

I have uploaded the "X1M Platinum Edition Quick Start Guide first release V1.pdf" to the files section. This document appears to be a draft, and I expect things will change but it does give us an idea of what to expect.

The document is in Chinese, and I have been unable to translate the entire document this stage. (I have used Google Translate to read some individual sections, but the entire document just won't translate in "one go" for some reason...)

I thought it wold be good to share this, and if someone is able to do a full translate and then "re-upload" it to the group, that would be great.

I will post any updates that I find in this thread.

I hope that's just a typo on 80 meters it's still in region 1. Shouldn't that be 3.5 to 4.0 MHz?

Got the reply from Wimo. We won´t get the platinum edition in Europe. All rigs delivered to our region have to be CE certified. To avoid this issue Wimo will get a nearly complete assembled radio. You will only have to mount the pcb into the case, put the knobs etc...
Unfortunately the X1M Platinum is only available as ready-to-use rig.
So, no X1M Platinum for us :-(

Be careful with that. Originally the kit version that was offered with the first model here in the states was speculated as being an easy-assembly (KX3 Style) kit. I received a kit that had only the SMT parts completed, with a bag of thru-hole parts, boards, connectors, and no instructions for assembly or a schematic. Dale at Kight Radio exchanged it for an assembled one.

From: Bruce
Topic: 591 Message: 613

I've dug a little deeper and am still having no success. Here's what I know so far:

Opening the stock mike and using an ohmmeter, I see that ring goes to the PTT switch and tip goes to the mike cartridge. (The other side of both the switch and the mike cartridge are tied to sleeve (ground). At the radio, when PTT is grounded (active), tip goes from open circuit to about +7 volts (relative to sleeve ground). I assume this is the bias voltage needed to power the electret cartrige in the stock mike. However, hooking a different electret cartridge (from a pc headset) across tip and sleeve (yes, I got the polarity correct!) and grounding ring (PTT) does not give me any audio. What am I missing?

OK, so last night I bit the bullet and completely traced the circuitry inside the stock mic. The only additional components are:

- A .01uf disc cap across the mic cartridge. I assume this is just there for RF bypass and high frequency rolloff. It shouldn't be required for the mic to function, right?
- A 4k7 resistor in series with an LED between tip and ring. This is obviously the transmit light on the front of the mic.

There are a few other items related to the disabled speaker in the stock mic. For the X1M, none of these are ever in-circuit.

After looking at all this, the only conclusion I can reach is that the stock mic cartridge has much higher output than a PC headset mic. Before I go hunting for a mic preamp, could somebody please prove me wrong?

Here is a picture gang that I found in my emails when I tested the radio in August 2012, I did not realize I had all the testing in my sent items box along with pictures..

As you can see the Ver II has come quite a way in looks and the Platinum with new display will be even more better looking.

Question: RS-232 defines mark/space or 1/0 as -3 to -15 volts and +3 to +15 volts

And the schematic shows TTL levels: 0 = 0volts 1 = 5 volts.

You plugged in the rs232 cable and it worked?

Subject: RE: [X1M_QRP-Transceiver] Knobs

Anybody make an interface cable from the x1m to USB - computer? From the schematics it looks like a ttl interface which should match up nicely to a chip.

Would love to see some.

Rick - w4rp

From: X1M_QRP-Transceiver@yahoogroups.com <mailto:X1M_QRP-Transceiver@yahoogroups.com> [mailto:X1M_QRP-Transceiver@yahoogroups.com] On Behalf Of Lee - N9LO

Hi Rick,

I did successfully make a cable. I posted all the details awhile back I'll find the post and link it. In short it is TTL level but the pin outs are the same as standard rs-232 -- re -- the TX, RX, and ground pin assignment are the same location on the db9. I used a $2.xx bare USB adaptor off ebay with wires going directly to the db9. I recently ordered a nicer version of that and a db9 connector to permanently mount it to.

I ordered and received:
1 -
http://www.ebay.com/itm/130922178716?ssPageName=STRK:MEWNX:IT&_trksid=p3984.m1439.l2649
1 -
http://www.ebay.com/itm/271211061815?ssPageName=STRK:MEWNX:IT&_trksid=p3984.m1439.l2649

With the intention of snapping them together, adding some heat shrink and being done with it. Originally I used:

http://www.ebay.com/itm/1pcs-USB-2-0-to-TTL-UART-6PIN-Module-Serial-Converter-CP2102-STC-PRGMR-/251039347548

Something like that. I think my original post was under something lke HRD Working! I'll look for it and link it for you.

I have not connected to HRD or PC yet, but I followed this thread,
http://groups.yahoo.com/group/X1M_QRP-Transceiver/message/430?l=1

Bought the cheap USB to RS232 module,
http://www.ebay.com/itm/330616868559?ssPageName=STRK:MEWNX:IT
<http://www.ebay.com/itm/330616868559?ssPageName=STRK:MEWNX:IT&_trksid=p3984
.m1439.l2649> &_trksid=p3984.m1439.l2649

and a male db9 to male db9 cable. That is the reconfigurable way to go but
sure, a ready made cable that worked would be better.

I'm waiting for the radio and adapter to get here. By the looks at the next messages I ordered the wrong thing. So the one I ordered will go in to my spare parts box. I saw the connector and guessed it was the same as another radio I had, the Ten Tec Pegasus.

Lee - N9LO

Hi Guys,

Be very wary of postage charges when checking items on FleaBay.

I did a search for "USB to RS232 Serial 9 Pin RS-232 DB9 Cable Cord Adapter" and listed the results sorted by PRICE PLUS POSTAGE.

The most expensive was US$5.42 PLUS US$48.88 POSTAGE, and was listed from the USA -- While the cheapest was US$1.00, postage included, sent from Hong Kong.

Don't get caught out by ripoff "postage and handling" charges.

Cheers,

David Harvey, VK2DMH

I don't have the radio - BUT the schematics clearly show the I/O pins are xmit/receive data are TTL level with current limiting resisters --- IF YOU PLUG IN A RS232 INTERFACE (the RS232 interface definition is a voltage definition of -3 to -15 volts for a 1 and +3 to +15 volts for a zero) it will kill your radio. unless the current limiters prevent it -- but i would not chance it. you need a 0volt to 5 volt interface. I say kill your radio,because the radio IS mostly done by the CPU - and the DB9 pinouts go directly to the CPU (with the current limiting resistors).

here is a ebay search term one of you posted that i also used - there are several of these - varying lengths of cable, etc.

1m PL2303HX Download Cable USB To COM USB to TTL Converter Cable

DON'T use an RS232 one! you may get lucky but why take the chance of destroying the radio with a $3.28 cable?

just saying...

cheers

633. X1M Cat Commands. RX / TX?

From: pezcat19
Topic: 633 Message: 633

Hi all,

I am eagerly awaiting my X1M Platinum Edition to arrive, and thought I would have a look into the supported Icom CAT commands. This has led me to a question....

Does anyone know if the X1M can be made to TX/RX via CAT?

I had an IC-718 once, and the BIGGEST problem I had was the fact that most early Icom CAT radios (including the IC-718) do NOT support TX/RX switching via CAT! This is a real PITA.

I really hope they have implemented more than just the 718 command set, as it is limited in this regard (and for example, it makes fully IP remote operation of the rig more complex than it needs to be...)

Hi Mike.

This is great news for us in VK and ZL! (I have purchased some equipment from you and Dave in the past, and I was very pleased with your service :)

Can you share any pictures and information on the production units with us here in the group? We are all very short on details at this stage. This would probably encourage some new orders too!

I noticed they are shipping or expecting the above model very soon..great.
What is the warranty on these?, one web page sells them, no mention of warranty, and kight says 6 months, but you can get an extended warranty for two years for a low minimal price......

So does anyone know the scoop..

Gang,

So I'm an idiot, go lookin' for QRP transceiver on eBay. Came up with the usual and then . . . I saw this:

http://www.ebay.com/itm/Youkits-EK1B-3-Band-HF-CW-QRP-transceiver-assembled-Morse-code-20m-17m-15m-Band-/271244485581?pt=US_Ham_Radio_Transceivers&hash=item3f276e63cd

I looked at the box, at the pictures of the innards, all that, and thought "Will this madness never end?"

Something gives me the feeling that it's too good to be true (he said, having fallen for that bit maybe 12 brazillian times over the past six decades and some).

Or is it just me sees only one of what might be the LPF on the board of a three band radio?

You only need one high pass filter on this type of QRP radio. The 2nd harmonic of 14 Mhz is 28 Mhz so one high pass filter at about 23 Mhz is all you need. I hope. Mark/WQ8S

Hi all,

Ordered the radio from Ed a few weeks back, been lurking here since then. Looking forward to getting and sharing what we find out about this cool new toy.

Last night I found a new video from VK3TWO, I think he imports them into VK-land.. Nice to see the buttons being pushed and settings played with

http://youtu.be/je54LhIf3Zg

He's also put one up where he compares the size with a FT-817..

looks like we're going to have lots of fun with these!

Price isn't too bad Introductry Price of $350AUD but I wouldn't even consider it at his RRP of $499AUD

The TaoBao price worked out at about $220AUD but now they wont send out of China, plus you had to navigate the site using Google Translate to get around all the Chinese characters. I managed to register (hard) but didn't go thru with the order, so I've missed out there.

I might have to consider the $350AUD, but at the moment I'm still not sure with reports of low power out on the X1M. I don't expect much warranty support, but Spooktech would need to follow Australian Law, so I wish him all the best.

646. Antenna Tuner to compliment X1M

Yahoo group: X1M_QRP-Transceiver (2013)

Hi All, enjoying the posts on this new Radio.

Considering the purchase of the X1M Platinum to operate with
a Multi Band HF Whip. However it is likely an antenna tuner would be
required.

Any suggestions on a small (non auto - considering price) Antenna Tuner
to suit this very small radio.

Hi John,

I occasionally use a "Miracle Antenna" on my FT817, and while it is a compromise antenna, I find it works surprisingly well when used with a 10m (30ft) counterpoise wire. I have worked every state in VK, ZL and even Japan with the antenna, while operating portable on battery power. It very easy and FAST to use - and because of this I find it fun to use. You can also remove the whip and tune wire antennas with this unit:

The original MW can be hard to obtain, however a Chinese company is making a copied version now, and the price seems reasonable: http://www.ebay.com.au/itm/Portable-QRP-All-Band-Antenna-with-detachable-whip-for-HF-UHF-VHF-Ham-Radio-/221262011908

An X1M with the SO239 connector will work best with these antennas.

At the other end of the antenna scale, I also use an Elecraft T1 ATU to tune random wire antennas. This performs very well but is much more expensive than a Miracle Whip style antenna...

Another option to look at would be some half wave end fed antennas, or a magnetic loop, or a dipole, or an ATX walkabout etc.... The list goes on, so it all depends on what you plan to do with your X1M.

I hope that helps!

Well, the smallest in my stable is the QRPKits SOTA tuner which has a built in SWR absorptive bridge. When weight is a consideration, this seems to be the best bet.

Otherwise, the MFJ-902 series -- you will either need the version with an SWR meter, or get a <gasp> "CB" type SWR meter.

As to ATUs, if you want to consider them the LDG Z817 is what I use for field work with my FT-817ND and QRP rigs sometimes. The LDG is designed for use with the FT=817ND, but works fine in "manual" tune mode.

If your going to use an End-Fed-Half-Wave, KI6J's EFHW tuner is your best bet for portable ops.
That can be found on BetterQRP.com

Google AA5TB and read about endfed antennas.

Some friends like the small Elecraft auto tuner.

I use a Z-match tuner in the field and a Home Brew
parallel tuner at home.

I just bought a used LDG Z-11 Pro automatic tuner for $100 on eBay. I also ordered a HF Pack Amp Kit for the days where you need just a little more and a couple of 6800mah 12 volt Li-Po batteries. Now, if only my X1M Platinum would get here.

John & the group,

I have a very nice & compact Z-match that I use with the FT817ND. I have also built one with heavy-duty components (a 4-inch toroid, for starters) & motors that is remote tuneable that I use with the big station stuff (IC718/IC706).

I highly recommend the Z-match. The Emtech version is very approachable & easy to build. I believe it's probably the most efficient antenna tuner you can use. And I'm surprised that no one has come up with the math/algorithm programme whatever to make an auto tuning version.

If you use the polyvaricons that are on eBay & a reasonably sized toroid (1.5 inch) you can build one that's pretty dagnab tiny. Easy fit in a go bag with the X1M . . . once it's been cleared & moded, if such a beast exists.

So yeah: Z-match.

X1M version 1.2

Tests measurements done now with 13.8 volts (before 12 to 12.5) with my now fixed Astron RM-35m.

4.64 watts on 40m, 7.050 MHz, Elecraft DL-2 showing 10.66 volts
4 to 4.23 watts on 20m, 14.050 MHz, showing 10 volts
5 watts on 10m, 28.050 MHz, showing 11 volts

Above with steady CW tone, X1M on manual keyer.

From: Fred VE3FAL
Topic: 657 Message: 657

I looked at the manual and did not notice that the X1M Platinum has no sidetone control in the menu. Ed do we know if a hole was put in the top to adjust the sidetone?

Is the new cable USB for the radio control, I think I seen something about that as well a bit ago.

See how this unit looks once it gets here for sure.

I like the forbid transmit setting and I am guessing that can only be changed via software, or is it a flip of the menu to a 1 from zero for other bands?

See what happens when the rig arrives.

Fred

660. X1M Platinum in Europe?

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-05 16:02:12 UTC
From: Andy
Topic: 660 Message: 660

The German reseller Wimo has told me that they will not get the Platinum edition in Germany due to missing CE sign. Is there somebody selling this rig in France or UK?
Thanks,

73 Andy

661. Reference Manual

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-05 18:46:52 UTC
From: W3FIS
Topic: 661 Message: 661

I have talked to Ed to get his "OK" on this. Fred, VE3FAL and myself have agreed to take on the pleasant task of working up a readable (English/American/Canadian English) version of the manual for the X1M "Platinum" version. The current game plan is to take the two current manuals, harmonize them to reflect the workings of the platinum version, and flesh it out with a little more information gleaned from this group. Perhaps some more photos will be added.

If anyone has something they might like to add, or the like. Please let us know.

Of course, I am waiting on my X1M like everybody else, but we would expect to have something put together in a couple of weeks, if the creek doesn't rise....

662. Boned by Kight Radio

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-05 23:23:17 UTC
From: petro_dad
Topic: 662 Message: 662

I ordered my X1M back in May of 2013 from Kightradio.com. It would not transmit and I emailed Kight and was given a RMA of 14 and the address to send it to. I sent it on May 25.

On June 14, I emailed them because I had not received the refund and they responded saying they would be sending out refund checks on the 17th. It was signed by some guy named Suyan.

Since then I have not received a refund. I have called both phone numbers innumerable times and no answer. I have emailed them directly and from their website. I have offered to take the refund in the form of merchandise if they need to, but no return email from them.

I seriously think I have been scammed. Anyone know whats going on with this bunch or have another way of contacting them?

Many thanks,
Jeff in Texas

Don't think you have been scammed but caught in a bit of a blunder with a huge number of returns and the factory trying to make good the Ver III unit. I know Dale spends lots of time over in China and busy there.

Please do not get too frustrated and I hope you will hear from them soon.

Fred

G'day Jeff,

Same boat as you, mine arrived in March and had no Tx, was given an RMA of 8 and sent it back for a replacement, managed to get a phone call answered in early June that the replacement would be sent direct from China around the 21st June - well that date has come and gone and like you I haven't managed to get a reply or phone call answered.

Currently I'm seeking a chargeback from my Credit Card to recover my purchase price....

This is my second radio and it has no output on 10 meters. I informed Dale of my problem and I needed a RMA number. I was told to wait for the new ones to come in and then I'd get one. that was back in June. I know it's frustrating and I must have called a dozen times with no response. Fred if you have any communication with Dale, you need to have him issue a statement reassuring his customers and what the status of the new radios are. He is not answering his phone or his emails and this is unsettling to a lot of people. Just my two cents..... Strike that make it 12 cents (inflation) [:)] .

Hello Gentlemen,

RMA #12 here, in the holding pattern also. As I've said in a previous post, let's be patient. I'm hoping we all get replacement radios from this newest batch. If not, then I hope we can get some answers. Until then though, it's a waiting game. This is a time to try and stay optimistic. Kinda wish Dale would at least make a blanket statement of some sort. But yeah, we're all in the same boat. Time will tell. Yup...

From: VE3FAL-Fred
Topic: 260 Message: 669

Good morning folks, I just wanted to let you know that I had an email from Brandon at Kight Radio last night as I promised I would find out something for the group.

Brandon told me he will have Dale contact me (next couple of days) so I can get a more detailed idea as to what has happend, but I can at least give you folks a few small details:

1) Deliveries and finished products from the factory have been the main reason why things are behind. The factory is about one month behind on orders. For those of you who do not know how some of the industry works in China it is an interesting thing. many of the Holidays that they have in China shut down all factories, deliveries etc... Example is Chinese New Years, for that week nothing moves in or out of there...Of course deliveries can be slow, but DHL is pretty quick.

2) Dale is currently at home recovering from surgey, I have no other details on this and of course it really is not my business, but he is recovering and just got home.

I hope this helps to ease some of the questions and uncertainty out there.

for any other Canadians waiting for theirs, you can use the tracking number from stamps.com on the Canada Post tracking tool.

mine shows in customs, which means anywhere from 1-10 days until it gets cleared...

those of you who got yours, does it have a BNC or UHF antenna connector?

From: Charlie , W5COV
Topic: 671 Message: 687

Just picked mine up here in Oklahoma . BNC also . WOW TINY !!! Red insert volume/power knob . Luckily I had a power cable already made up that fits it .

Going to have to do some reading and studying now . Just turned it on and with volume wide open have to lay my ear on the speaker to hear any background noise . No antenna connected yet .

LOTS of stuff on the display . Now to begin to learn to use it . Looks like a lot of trial here at first and trying to find as much information as I can until a manual gets written . I'll keep good notes .

Sure is cute though .

More later ,

Charlie , W5COV

Look for a powered USB hub. That will add additional USB ports with the
required 500 ma per port. A hub that is not powered, with split the 500 ma
among any active ports in the hub.

Yes very short CAT cable :) 4 1/2 inches with cable stretched out and measuring from end to end on connectors .

You have to make yourself up a power cord unless you are a builder like me that seems to have a couple of everything , when I can find it :) The connector is provided , but you have to supply your own wire . Also included is a plug for an external speaker .

Just giving a heads up to those of you that may not have a shop plus test bench equipped like mine .

Going to master this display and settings before I even attempt to do anything with the CAT controls . Three wires used with all DB-9 connectors .

More later :)

I just received yesterday, the USB to the TTL level DB-9 interface on the box.

http://www.ebay.com/itm/271211061815?ssPageName=STRK:MEWNX:IT <http://www.ebay.com/itm/271211061815?ssPageName=STRK:MEWNX:IT&_trksid=p3984.m1439.l2649> &_trksid=p3984.m1439.l2649

$2.53 takes about a week to get them. They are USB cables with four individual push on connector pins at the end. That will make an interface.

You will need USB to TTL Serial Cable Adapter and Serial RS232 DB9 9-PIN MALE Assembly like the ones I ordered below. Then see message 430 for the wiring.

http://www.ebay.com/itm/EP98-USB-to-TTL-Serial-Cable-Adapter-FT232-USB-Cable-Computer-Cable-High-Quality-/111139293937?pt=US_Audio_Cable_Plugs_Jacks

Well, cant I just open this Cat cable thingy here and attach it with any ol usb chord I have here?

I'm pretty savvy with a soldering Iron....This is the first radio I have bought premade. I have 4 other radios I had to make from kits.

Inside the USB to TTL Serial Cable Adapter is a circuit to convert the signals to a TTL level. You cannot just connect an old USB cable to a 9 pin plug. You may kill the radio.

Andy ,

If you get it in time , will you take a special listen for we X1M users
? <grin>

Shoot we need to have an informal net or group frequency to listen for
other owners on . SSB CW/DIGITAL on common bands .

OK! Mine arrived this afternoon, and up and running.

1. As shipped power plug NOT the right one -- already had a 5.5 x 2.1 for other QRP rigs, so good to go there.

2. Side tone is LOUD!!!! Has anyone addressed that issue in the Platinum version??? I haven't opened up the case to see if there is an adjustment.

3. Documentation -- I have a ROUGH draft together, and will clean it up over the weekend, and post it. I would appreciate any input after you have had a chance to take a look at it.

4. To avoid scratching up the bottom of that pretty case, I have put four silicon rubber feet (your local hardware store) on the bottom

REALLY nice radio. This is going to run the Yaesu FT-817ND off the road!

To be able to see what I am doing, I have had to prop it up on a "Nifty" HT stand!

The sidetone issue was addressed last go round but guessing that was not priority but the filtering and power and such would have taken stance. One method would be to drill a hole in top cover and allow adjustment of the pot.. A sidetone adjustment in the settings/menu would be a great idea for sure.

Have not got my X1M-P yet but how does this compare heat wise to the X1M?

I agree Paul such a radio will be a run for some of the other competitors who have not brought any new gear to the QRP world.

Can't compare them since I never had an early model , but it gets warmer
than anything solid state than I have in the shack .

I haven't even transmitted yet , due to a busy day , but been listening
all day . But from what I have played with it , there isn't anything
that can come anywhere close to it , especially for the price .

Has anyone tried to transmit outside the 5 bands yet ? Hope they left
that alone . Hate to have to look for an early model too . Nice display
and easy functions on this one.

I hate to drill a hole just in case it would void any warranty .

I think the the hottest parts in receiving operation are the DDS chip AD9850 and the power regulator. In some homebrew projects the AD9850 needs about 150mA at 5V operation.

Mine got very hot while just sitting on my desk in receive mode while I was trying to hook up the radio to HRD with the CAT cable that came with it. (Which didn't work BTW)..My little desktop fan cooled it quickly.

I am worried about this as I got this radio for Mountain Top SOTA operations. Guess I will get one of those little battery operated fans to put in the Go-Bag.

718. external Keyer?

What's the word about using an external Keyer with this X1M-P?
I'm not too fond of the X1M-P's on-board keyer, nor that of the original for that matter. The dits and dahs seem too short for what I am used to. Can this be changed maybe?

I have an external keyer. An SKC keyer to be exact that I build up by buying the chip, and following the schematic. I have this set up to be a practice oscillator and keyer for some other CW rigs that I have.

Don't want to risk pairing the two if I will fry the X1M-P

I think at this point additional cooling would be a good idea . I hope to get it on the analyzer and the bench for power testing today .

When hooked to a dummy load , it appears this model will only transmit on the 5 ham bands . You get an annoying tone if you try to key the microphone outside the bands , plus no red light on the microphone like you get "in band."

Hopefully there will be a mod for this .

I am also going to have a look inside and turn the sidetone down and see if it is indeed the DDS VFO generating the heat and see if there is a way to possibly add some heat sinking to it .

I am still enthralled with the size of the rig !! I have been advocating a rig pretty much with the features that this one has for the past few years .

This rig should attract many newly licensed people , due to its "high power" and finished product form , and especially a price that "most" anyone involved in ham radio can afford .

Low power 1-2 watt kits , mainly CW , and some kits even priced higher than this , were a HUGE stumbling point , in my opinion for many newly licensed hams . Plus I think at least for beginners , ALL of the radios should be 5 watt rigs . I have seen so many people fall by the side of the road building a Pixie or similar radio , with their chance , if they even know CW , of making even one contact and on a single frequency on a single band being nearly zero . Plus they don't have to know how to solder and build a kit and hope they can get it working , especially if they have no experience at all in even basic electronics.

There is a good opportunity here for some ambitious hams to build many matching accessories to match and go with this rig . They could make a nice little home ham business out of it . I have already built several accessories for mine , while waiting , but wanted to have the radio actually in hand to test them with it . I can't financially afford to start up such a business , so it is a GREAT opportunity for someone . I have an antenna tuner built for it , a different mike , naturally a home brew dummy load , build and offer some antennas , power cords , external speaker , maybe internal heat sinks , won't know until I look inside , small fans , a small handy talkie type slide in bracket for it. The list is unlimited and this rig is destined to be a huge seller !! It DOES need the feet that someone mentioned , to keep from getting it scratched up .

So far it appears it is going to just blow the competition away !!

If I get my testing all done this afternoon , I hope to make a few SSB contacts on about 14.310 or if that band isn't in good shape , maybe around 7.235 , depending on how clear those frequencies are . Likely be after 01:00 UTC . Other frequencies if someone has a better suggestion .

OK gang, the preliminary PDF user's guide (in English English) has been uploaded to the file section. I took the liberty of getting this up, since we have been receiving our radios the last couple of days.

I have done a serious "cut and paste" job on the Chinese manual. I think everything is right, but let me know if either something isn't clear, or I am missing something critical.

Mine has a rather "hot" side tone, and I've not tried out the computer interface at this point.

There are some pretty serious differences between the earlier X1M operation and that of the Platinum one. All for the better, IMHO.

I too hope that it was just the CB portion of the band that was locked out and that the other ham bands are also open on it.

Will have to see.

I noted in Ver. I and Ver. II that they both got very warm, I am sure that with all the DDS in there to make this so small that is where the heat and the current consumption comes from.

I hope y'all are having fun so far that have received your radio.

Fred

The AD9850/AD9851 is spezified for up to 85°C. I think the chip is running in it's spezified range. The heat could affect some other parts in the rig - let's see.
Don't know how to get an additional air flow in this nice housing without drilling holes in it.
An other way is to increment the voltage for the AD9851 to 3.3V and/or change the power regulator to a switchig power regulator with less losses.
There is enough place for modding the X1M.

I have super glued a penny to the top of the chip. Someone posted this
awhile ago. Seems to help, mine has been like that for 3 months now.

But the heat is still inside the housing. The DDS chip is now a little bit cooler, the rest a little bit hotter.

I have an older Heathkit keyer. What I did is set the X1M for manual keying. Purchased a mono to stereo adaptor plug from Radio Shack and plug & play. It works great! Just need to turn down the sidetone inside the X1M, it's a little too loud for me.

Never thought to try CB , but I just went through all of the other bands and they are all locked out on transmit , including 160 meters , so it is not just the WARC bands . You just have 5 bands now .

Was sure hoping it would remain open since that is one reason that I bought it was to be able to use it as a low power IF radio , and I sometimes have odd IF frequencies . Nothing to allow transmitting anywhere in the MF/LF range that I have found or the MARS frequencies . I am hoping that there is a mod to open up the transmit .

I looked through the manual that was uploaded, and there appears to be a setting that you can change. Might be a way.

Kinda thought that would be the case to open it up.

This has been tested and true?

Yes I changed it and it opened it up .

THANKS for the manual , will have to read it and see what I have missed on my own .

I am having a ball playing with it and look forward to a lot more portable operation now when I am away from the house. Easy to make a complete tiny little "GO KIT" with it .

They aren't going to be able to keep these in stock for quite a long time , they will be flying through the mail so quickly .

Now maybe I'll even see how many bands I can do WAS on with it even in these terrible conditions . Sure would be nice if we could decide on a "watering hole" for the different bands to work others with them .

Also a weekly net to swap information will get us away from the keyboards and on the air and letting more people know about how much fun they can have for such a good price !!

I rarely get excited about new products after 48 years as a ham , but by golly this little rig does excite me !! Can't wait to start taking it to club meetings and showing it to prospective hams . This "should" really raise the number of people getting a license and then becoming active with a working rig they can afford !!

It will be nice to see a schematic on this new one and see how parts availability is , because at some point some will need to be serviced and I want to really understand this little jewel .

One day finding a dead one , either model , really cheap would be great , so a guy wouldn't be afraid to do some experimenting and playing .

Thanks guys it is a great little radio for sure.. Every time I open one up I can't believe how compact it is and what it is capable of doing.

Have fun playing and experimenting folks.

Fred

Thanks, And I agree about the side-tone being too loud...might be a matter of adjusting a resistor on the inside....Thought they might fix this issue since we griped about it in the previous model.

From: Lee - N9LO
Topic: 741 Message: 741

My new radio got here this afternoon ant it receives great but when I plug the Micrphone in the speaker goes silent. I opened up the mic plug and the red wire goes to the tip, yellow to the ring and nothing to the ground. Could some open up their mic plug and let me know? Thanks.

Also I see my display angles a little to the right. I will see if I can move it a little.

I received my X1M platinum yesterday, but my unit has little to no audio through the speaker or headphone jack. And when you crank it up so you get low levels of audio and louder hiss sound. The hiss appears to be from the unit, not from the band when comparing to my other radios. As of now the unit really isn't usable, so waiting to hear back from Ed on a course of action. Anyone else experience this? Is there a fix?

I had to lay my ear on the speaker to hear just white noise when I first received it and hooked it up . However I did not have any antenna hooked to it . When I plugged in my G5RV , it came to life and I am listening to it on 40 meters right now and am running less than half volume .

I also have the attenuator off and the preamp on .

Also have you tried a full reset ?

In my microphone there is no white and I did find the black wire connected under the other wires. Whit I did figure out is that the Yellow wire was connected to the ring and it is really the speaker wire and the green wire which is the PTT was not being used. A quick switch and all is well.

Very good Lee , glad that you managed to get it going . I can barely see the end of a white wire sticking out of the jacket . Since it is a repurposed speaker / mic I guess it is for the speaker .Looks like the color coding is not standard . I don't have a green wire . I have red , yellow , black , and the white that isn't used .

Glad people are posting their problems and solutions on the group here , since there seems to be some minor differences and just our exchange may help someone later on . At least they now know how two of the microphones with different colored wires are used .

Good DX .

Topic: 706 Message: 747

I opened up the CAT cable that came with my X1M-P I got today and inside was a small board with a MAX232 IC on it. I' try connecting it to a serial - USB adapter to see I can get HRD to work.

From: X1M_QRP-Transceiver@yahoogroups.com
[mailto:X1M_QRP-Transceiver@yahoogroups.com] On Behalf Of ChristopherG
Sent: Thursday, August 08, 2013 5:33 PM
To: X1M_QRP-Transceiver@yahoogroups.com
Subject: [X1M_QRP-Transceiver] CAT Cable

So, since my laptop didn't have a serial port, I decided to upload HRD onto my work computer to test this CAT cable since my work computer has serial ports.

HRD cannot seem to connect to the X1M-P with their supplied CAT cable, what am I doing wrong?

Im using a 6' extensions between the Computer and the CAT cable which is plugged into the radio.

Thanks! Great job!

A short "technical supplement" which includes things like the sidetone adjustment, Microphone and CAT pinout details, etc would be a great addition to this.

Over the coming weeks I am sure most things will be covered on the group in one way or another, so it would be great to capture this in a single document.

I can't wait for my X1M-P to arrive here in VK land! :)

Be careful with using these unlocked. The first models were putting out some good-sized out of band spurs when used outside of the filtered areas. I know on mine, you can hear the relays click as you cross in and out of the filtered ranges. One way to tell, is that your antenna tuner will find multiple "solutions" when you are using it out of band. This was all discussed earlier in the forum. The spurs seem to be about 9MHz above the Xmit frequency. Read this post all the way through:

http://groups.yahoo.com/group/X1M_QRP-Transceiver/message/392

I observed similar behavior in my X1M. Just be aware that you may need some outboard filtering on the WARC bands.

Lee been there and done it, I posted the pictures of the cable in the files section as well of the chip and wiring. I have had no luck getting HRD to work or any other program as well with that cable..

Will have to keep trying and see what happens, just wish a cable was made to USB as my newer Samsung and netbook do not have anything but USB

USB would be nice for use on my 10" netbook. Standard port does work on mine. Had no problem getting HRD to work on an older Dell laptop with 9 pin port. Auto detect speed, Check RTS and DTR flow control, popped right up.

I have an older dell that now has backlight(display) issues, can barely see, would fix it but not sure if it is worth it, that was my dedicated EMCOMM digital laptop, then when it crashed just grabbed a netbook to do what I needed.

Probably not worth it Fred. We'll figure out the usb problem. I may order a couple of converters and see what I can get going on the netbook. It will be nice to keep everything small.

Attenuator is NOT implemented. See our preliminary manual.....

Mine got hung up once, and a full reset restored things to normal.

This has been my experience with all of my various embedded processor radios (Yaesu, Baofeng, Wouxun)

Microphone pin out is down toward the end. I checked my microphone with a multimeter.

Will discuss side tone when I am confident about how to get the case off (notorious screw on the bottom issue). There is an image posted of the insides. I would expect that to be pretty much the same in the new one.

I haven't gotten the CAT cable to work yet. I need to install the driver for my RS232 to USB cable converter. No joy yesterday, but have only had the radio less than 48 hours!

We "pre wrote" the manual, using the structure of the first version manual, and art clips out of the "Chinese English" Platinum manual. Then, went over the details. Concepts the same between the two radios, but implementation quite different.

We need a good photo of the BACK of the unit. One in the manual is for the older/European version. Can somebody provide one? Send to me off list.... JPG or BMP will do nicely. deadgoose@....

We didn't put anything in the initial manual about running out-of-band. As shipped, if you try a WARC band -- I tried 30 MHz -- you get a nasty "Beep Beep," and no transmit. I need to set parameter 11 and see what happens.

What is the opinion of the group? We have a legal/ethical issue here. I would prefer NOT to discuss it? That sort of goes in "at your own risk" issue.

Also, do we void the warranty if we open the case to set the side tone level? BTW, HOW do you open the case -- I am aware of the screw on the bottom issue...

Here is a link to drivers that was on the page I bought my USB to TTL cable.

It has numerous drivers wrapped up in the ZIP file - and some docs.
Including a test routine.

These should work for all CP2010x chips that are normally used inside the
USB connector for the conversion.

Hope one of them work for you and everyone who bought one from someone that
didn't give them a driver.

OK, case removal (really easy!) from Fred ---

1. Disconnect all wiring.

2. Slip both knobs off -- may require a little persuasion from a thin item, like jack knife blade.

3. Remove the nuts on the volume control and frequency adjustment shafts.

4. Remove all four screws on front panel.

5. Remove ONLY two top screws on the back panel.

6. Case simply slides forward!

2.5 mm Allen wrench or 3/32" does the trick. 2.5 is a better fit.

Re-assembly -- reverse the procedure.

Now, for the $64 question -- the board layout is different than in the older version. WHICH pot is the side tone adjustment? Should be the left hand one (when looking from the front of the radio).

OK! We have photos of the rear panel, so that issue is nicely resolved. Thanks!

Next item -- WHICH pot is used for adjusting side tone? Likely left-hand one, from the display end. Board is different in this model versus older one.

Is the pot a single or multiple turn pot???

Thanks in advance!

Multi turn pot on the left. Turned 90 degrees clockwise on mine.
Be very careful with the volume control knob, Mine was very tight and pulled out the shaft. Have it back together but it will not lock into place. New control needed.

I have a cheap USB to serial adapter and connected it to the supplied CAT cable and could not get the radio to connect to Ham Radio Deluxe. What did work was the $2.11 eBay USB to TTL serial cable that I soldered to a DB9 connector. The converter is built in to the USB end of the cable. I wired the DB9 using info from message 430. I did notice that some of the eBay ads say green is TX and white is RX and some say the opposite. At first my cable did not work so I just flipped the wires on pins 2 and 3.

Got things to work this PM. Consists of:

Interface cable they sent us.

IOGear GUC232a, which I had for something else.

USB extension cable, as the pigtail on the IOGear unit was pretty short.

Cable tie down to the desktop for the stuff, so as not to put undue strain on the interface cable.

I have documented what HRD commands work. Most of the important stuff. A great relief for my 75 year old eyes!! <grin>

See just posted revised manual for what we know. The side tone issue has been resolved -- left hand trim pot.

Radios are tested before leaving the factory. In addition, your radio was tested on my bench before shipping, since it was a replacement for the first one you killed. Both CW and SSB were 4.7 - 5 watts on 40 meters.

Word of warning -- the transmit spectrum is horrific for some of the "other" bands without filters. 30M is particularly bad. I decided to look at the spectrum after my ldg auto-tuner seemed befuddled when trying to tune on 30m.

For the bands with filters it doesn't seem so bad; but I've not looked at other QRP rigs recently to calibrate expectations.

Still pretty amazing for the price, not complaining -- but stick to the known-good bands for transmitting is my advice!

Hi all,

If the schematic that was posted to the group is accurate for the recently shipped units there actually doesn't seem to be AGC -- am I missing something?

I just tested it with a signal generator and that result confirmed that that the audio wasn't leveled until reaching what I presume are saturation levels.

Still usable and reasonably pleasant to listen on for my setup so far.

That would be my perception. I find the "preamp" give you some level of RF gain control (on/off!!!). They didn't put in the attenuator (software and display work!), which would have been nice.

Oh well...

Indeed -- after I posted that I did a more objective test with an o-scope and the generator confirming the first results (which were just by ear).

Between the volume and preamp settings I guess it is reasonably manageable. If we had more panel space it would be a straightforward hack to manipulate the IF stage gain.

And on the topic of filters and spectrum -- I saw your comment; I had missed the earlier thread on the filters. My only concern with those filters would be on bands like 30m, it seemed like a 20-ish MHz product (didn't look carefully enough) was at nearly the same power level, so if you don't apply the filters at a low level you will still have a pretty nasty spectrum and the PA will be fairly displeased :)

Good market for a solid pre-post selector to hack inline :)

From: W3FIS
Topic: 781 Message: 781

Lots of people have found all sorts of useful things about the radio. In that spirit, I am starting a thread on "hints and kinks" for the X1M. Please add to it, and after a couple of weeks, I'll take the liberty of editing them together and put the list in our files section.

To get things going, I have found:

1. Put some small rubber/vinyl feet on the case. This will save the pretty case from scratches, and likely give a little better air circulation. Hardware store item.

2. Take the sleeve off of the microphone plug and examine the solder connections, strain relief, etc. "Pot" the housing with some RTV silicon rubber, and put it back together. This will add to the mechanical stability of the connector. Hardware store again...

3. A VERY small dot of silicon dielectric grease (auto parts store) on the case screws will prevent galling of the steel screws against the aluminum case threads. A little on the control shafts helps as well, though I might wish that I hadn't. Auto parts store. Comes in little tubes. Useful for sticky threads on PL-259 connectors as well.

4. The screws on the case can be easily removed with a 2.5 mm METRIC Allen wrench -- local hardware store item, if you don't have one in your tool kit. Also auto parts store.

5. The internal trim pots can be adjusted with a 1.8 mm jeweler's screwdriver. The side tone one is on the left (viewing from the front), and about a 90 degree CLOCKWISE turn works.

6. If yours, like mine, came with the loudspeaker broken from the mother board, stick it back in place with a couple of SMALL dots of hot melt glue from the XYL's craft stuff. The glue appears to be polyethelene.

7. To keep stuff from getting into the speaker/case through those holes on the top, cement a square of plastic window screen on the underside of the holes. It won't harm the sound quality.

8. Stereo "Drugstore" headphones or ear buds work fine.

9. The threaded fittings for retaining the RS232 adapter can loosen up. Tighten them down a bit -- chimpanzee tight, not gorilla tight...

10. The power plug shipped with my radio was the wrong size. You need an "M" plug from Radio Shack. This is the standard 5.5 x 2.1 mm plug.

11. A 5 AH SLA gel cell makes a great "field" power supply.

12. Make sure to tie the RS232 adapter stuff down -- the adapter shipped looks a little on the fragile side. I had to open up the screw holes a bit in the connector to clear the requisite #4-40 machine screw.

Please add anything you might have found out...

Has anybody figured out a stand to put this thing on so that when using it on your desk that you can see the screen without breaking your neck? I have used a "Nifty" HT stand turned backwards with a big rubber band, but that really doesn't work all that well.

I am going to try modifying one of my lady friends plate holders for a stand . She has metal and plastic . I am playing with the plastic one so I can saw a few pieces off and use plexiglass to form a couple of holder/camps for the radio . The tilt angle seems about right just the arms need extended since it was intended for a plate .

Topic: 775 Message: 784

FWIIW, from a review I found: (this was the earlier one. I have no reason to believe they changed this)

The X1M is all made in SMD technology with 0603 parts; the RX preamplifier uses a very low-noise (NF:1.2dB) CATV 2SC3357 transistor, the IF is at 9MHz with a 6-pole crystal filter 2.2KHz wide, the mixer uses high-speed HSB88W Schottky diodes, the IF amplifier has a MC1350 stage with controllable gain (for AGC purposes), the audio amplifier is an LM386 (just 4mA of standby current) and the local oscillator is made around an Analog Devices AD9851 DDS.

And, to show that it's not a toy but a really nice tool at a very good price, it has an interface that allows it to be connected to the PC and operated via Ham Radio Deluxe or any other similar software, being compatible with the Icom command set (ideally, the IC-718).

Indeed.

My X1M is still in the mail, however I have already purchased some brand new plain black knobs to replace the standard ones as soon as it gets here. It cost about $10 total for a few different sizes at the local Electronics store (Jaycar, here in VK).

Hello Paul,

The text is from my blog, I wrote it. Indeed the IF stage uses MC1350 that has controllable gain, but instead of hooking the gain control pin to a control loop the manufacturer just applied a fixed voltage and the gain is static.

A simple mod can be done by lifting the RW1C pin that goes to L53C and connecting it to a circuit that picks up the speaker audio, rectifies it and adds a DC component to it; there is room inside the X1M for such a circuit.

Look for the BITX transceiver mods/addons/variants (from wich the X1M is loosely derived) for the AGC circuits, there are a few options, one is for sure G6LBQ's multiband version.

I think the competition is and has been there for a while and others have mentioned this radio in various blogs a few months ago. I signed up to aliexpress a while back to get updates on products as they sell a huge variety of stuff..

Anyway not to digress too much, if you look it shows that only 1 in the past 6 months has been ordered and no feedback as of yet.

Also makes note on availability on the site as if they would have to make it first, and I would guess based on orders.

Just my two cents worth for today.

Whoa! They claim 10 watts, they also seem to give a fair bit in the way of specs. And it does FM. They say up to 10 watts, then say up to 20, so what is it really? And a very cheap price. Very interesting. It ays nothing about computer control, however; am also somewhat curious about the front panel controls? Its dimensions would seem to indicate that it isn't terribly small, approximately 8"X8"X4", unless my math is way way off.

Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)

Foreword

This manual does not include installation and commissioning of the machine method contains only the daily use of the machine in the relevant section, if you

The machine does not install, commissioning, calibration is good, please refer to installation instructions and KN900 adjustment menu to enter a brief description

To adjust.

The specification for the KN900 MCU software version v01.05, you can see on the boot screen KN900.

This manual is higher than the software version for the function KN900 does not fully include, if there is a new software version,

Please press the corresponding release of the control instructions.

Developer undertakes to maintain existing functionality methods of operation, unless the function has been canceled or whose operation is significantly

Defects.

! ! ! Be sure to use when using KN900 power, antenna, speakers and so meet the requirements! ! !

KN900 panel a total of six buttons, three knobs, namely: POWER, DIS, F1, F2, F3, F4 four
Keys and IF GAIN, AF GAIN and the main frequency knob.
IF GAIN and AF GAIN which directly controls two potentiometers both were adjusted to put in place gain and low gain.
Please use the process of adjusting to the appropriate location in order to get a good reception.
Other use of buttons and knobs will be described below.

Time is limited, it is inevitable that mistakes and omissions, please notify us after you discover so that we correct the error as soon as possible, to facilitate more
More KN900 user.
3/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Switch
In the power-off state, long press the POWER button to turn on the machine's power;
In the power-on state, long press the POWER button to turn off the machine's power.

4/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Switching LCD backlight
In the LCD backlight off state, short press the POWER button to turn on the LCD backlight;
In a state where the LCD backlight turned on, press the POWER button to turn off the LCD backlight.
LCD backlight will automatically maintain the state until the next manual switch its state, without affecting other operations.
5/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Reorient the receiving frequency
Main frequency knob clockwise according to a certain value by stepping receiving frequency;
Rotate the knob main frequency step value can be reduced according to a certain receiver frequency.
If the rotary knob does not change the main frequency receiving frequency, check the following items:
Ensure that the main frequency knob is not locked, ie, the first character of the second line of LCD does not display a small key symbol;
Ensure that the current state of the VFO, that the first character of the first line of LCD as V;
Adjusted to ensure that the state is not currently RIT, that second line of LCD displays the last character is not a "<" symbol;
Ensure that the current does not hide the menu parameter adjustment of status, that is no longer the right side of the second line of LCD string of numbers.
6/27

Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Change the step value
DIS button Short press repeatedly, the second line of the LCD display is adjusted to the character shown below:
ATT RFA TS LCK
Now press the F3 key, LCD second line becomes the following display:
1kHz ^
Above the display and the machine corresponds to the current step value, then rotate the main frequency knob above the display will change back to more than
For example, when the main frequency knob clockwise one bar, LCD display will become the second line:
100Hz ^
"^" Symbol corresponds to that on the first line of the frequency A is changed when rotating the main frequency of the knob position to be changed. Step value is adjusted to the desired position, press the F3 key to return to its previous state, then re rotation frequency
Rate knob can be changed according to the new step value of the receive frequency.

Note: Change the step value, the main frequency of the knob and the step value of the direction of rotation can be adjusted between the selected specific adjustment method
See KN900 adjustment menu brief description (ver01.05)

7/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Save a frequency to current channel
If a frequency is that you always want to use, such as a local AM radio station frequency, you can use the KN900
Channel storage function will preserve these frequencies, the next time when you need to use can be very easily and quickly tuned to this channel, square They listen.
Current channel is displayed on the LCD first row, fourth and fifth characters represent the number at the channel.
To store a frequency into the current channel, you only need to ensure that the current work in the VFO mode, then repeatedly press the DIS
Key to adjust the second line LCD display characters shown below:
V / M A / B A = B V> M
At this point press the F4 key to store the frequency of the current work to the current channel.
8/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Memory frequency to the specified channel
If you want to store the current frequency to the specified channel, need to follow the following operations:
The KN900 switch to MEM state, if not the MEM status, you can repeatedly press the DIS button, the LCD section

Two lines adjusted to display the character shown below:
V / M A / B A = B V> M
Then press the F1 key, the first line of the LCD will display the first character is M, then by rotating the main frequency knob, adjusting Rounded to the need to store the channel, and then press the F1 key to switch back to VFO state, and finally press the F4 key, the current frequency will be saved
Storage reservoir to the desired channel to go.
9/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Switching channels
Stored in the channel more content, you can switch channels to listen to a desired program and signals.
To switch to a different channel, you need to switch to MEM KN900 state, if not the MEM status, you can
Repeatedly press the DIS button to adjust the second line of the LCD display characters shown below:
V / M A / B A = B V> M
Then press the F1 key, the first line of the LCD will display the first character is M, ie, channel state.
At this time the main frequency by turning the knob you can change channels, listen to the specified signal.
If the rotary knob does not change the main frequency channel, please check the following items:
Ensure that the main frequency knob is not locked, ie, the first character of the second line of LCD does not display a small key symbol;
Ensure that the current state of the MEM, ie, the first character of the first line of LCD is M;
Ensure that the current does not hide the menu parameter adjustment of status, that is no longer the right side of the second line of LCD string of numbers.
10/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Read from the channel frequency
In some cases, the need to adjust the reception frequency stored in the frequency down to a channel in the vicinity of such channel is stored in the 7.050MHz, and now have to work to 7.053MHz, which requires the frequency of the channel in VFO read channel status in the past.
Operation should be carried out as follows:
In MEM mode, select the channel to be read, press the DIS button repeatedly, the second line of the LCD display is adjusted to below
Illustrated characters:
V / M A / B A = B M> V
Then press the F4 key, the current state of the channel and frequency have been read out, and automatically switch to the VFO state,
Can be adjusted by turning the knob to the main frequency of the received frequency.
11/27

Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Switching mode
KN900 in LSB, USB, CW, AM, FM mode, these types of work, and you can switch back and forth,
To switch to a working model, you need to follow the following steps:
Repeatedly press the DIS button to adjust the second line of the LCD display characters shown below:
SSB CW AM FM
At this point, press the F1 key, the mode will switch between the LSB and USB, press F2, operating mode will switch to CW,
Press F3, operating mode will be switched to AM, press F4, operating mode will switch to FM.
KN900 now live mode appears on the LCD at the last character in the first line of each mode is shown below:

L U C A F
LSB USB CW AM FM

12/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Using ATT function
KN900 can be controlled via a relay pull and release the antenna to achieve the objectives incoming signal attenuation
The attenuation and attenuation of the two states can not arbitrarily switch, to switch to another state, you need to follow the steps below parade
Work:
Repeatedly press the DIS button to adjust the second line of the LCD display characters shown below:
ATT RFA TS LCK
At this point, press the F1 key will toggle between decay and not decay
KN900 now live attenuated status is displayed in the first line of the third character LCD to the left.
When the display is a long, the signal directly, that is not attenuated (unused AT T).
When the display is a short bar, the signal is divided by the resistor, i.e., the attenuation (with AT T).
13/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Using RF AMP function
KN900 can be controlled via a relay pull and release the antenna to achieve the objectives incoming signal amplification
, The zoom magnification with no two states can switch, to switch to another state, you need to follow the steps below parade
Work:
Repeatedly press the DIS button to adjust the second line of the LCD display characters shown below:
ATT RFA TS LCK

At this point, press the F2 key to zoom in and zoom without switching between
KN900 now live attenuated status is displayed in the first line of the third character LCD on the right.
When the display is a long, the signal is amplified, using the RF AMP;
When the display is a short bar, the signal is not amplified, that is, unused RF AMP.
14/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Use the lock function
When tuned to a frequency, we can begin to enjoy the waves of fun, but sometimes careless sensitive to touch down
Main frequency knob (the knob can trigger 40 times per lap, 9 degrees per turn can trigger a) In this case, you can use the lock
The main function of the frequency knob locked, ie ignoring the main frequency knob generated control signal. Locking and non-locking status can be
In any mutual switch, to switch to another state, you need to follow the following steps:
Repeatedly press the DIS button to adjust the second line of the LCD display characters shown below:
ATT RFA TS LCK
At this point, press the F4 key will toggle between locking and non-locking.
KN900 now live lock status display on the LCD first character of the second line.
When displaying a small key symbol, main frequency knob is locked;
When a small key symbol is not displayed when the main frequency knob is not locked.

Main frequency knob lock restrictions are imposed only on KN900 frequency, channels, and RIT (Receive fine) adjustment, KN900 its
All his keys and other functions are not restricted.
15/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Switching VFO-A and VFO-B
Now transceiver typically set VFO-A and VFO-B two frequencies, KN900 well. Set two
There are many effects of frequency, one of which can be stored in different frequency operation (SPLIT) of the two frequencies. Here's how
In switching between the two frequencies. To switch to another state, you need to follow the following steps:
Repeatedly press the DIS button to adjust the second line of the LCD display characters shown below:
V / M A / B A = B M> V
At this point, press the F2 key will VFO-A and VFO-B to switch between.
KN900 now live VFO status display on the LCD at the first line of the second character.
When the character A is displayed, KN900 in the VFO-A;

When the display character B is, KN900 in VFO-B.
16/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
With A = B function
KN900 contains A = B function, which can be very quick to VFO-A and VFO-B frequency set to the same frequency.
To use the A = B function, you need to follow the following steps:
Repeatedly press the DIS button to adjust the second line of the LCD display characters shown below:
V / M A / B A = B M> V
At this point, press the F3 key will VFO-A and VFO-B frequency equal.
When the current job at the VFO-A, the above result of the operation will VFO-B is equal to the frequency of the VFO-A;
When the current job at the VFO-B, the above result of the operation will VFO-A is equal to the frequency of the VFO-B;
17/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Using different frequency transceiver function
In amateur radio work, and sometimes need to get yourself receiving and transmitting equipment operating at different frequencies, for example, 7M-band and in the United States when contacting We usually transmitted on a frequency lower than 7.100 and 7.100 in higher frequencies on the next Closed, the other stations are just the opposite.
KN900 has a different frequency transceiver functions, to use this feature, you need to follow the following steps:
Repeatedly press the DIS button to adjust the second line of the LCD display characters shown below:
SPF K-O RIT
At this point, press the F1 key, using different frequency transceiver functionality and is not used to switch between different frequency transceiver function,
KN900 now live in different frequency transceiver operating status display on the LCD at the second line of the fourth character.
When the display character O is, KN900 in different frequency transceiver operating status;
When the character F,, KN900-frequency transceiver is not in working condition.

When you enable the different frequency transceiver function, KN900 will automatically PTT / CW reception and transmission control switching frequency.
When the current job in the VFO-A, press the PTT / CW, KN900 will automatically switch to VFO-B transmitter;
When the current job in the VFO-B, press the PTT / CW, KN900 will automatically switch to VFO-A emission;

When the current in the VFO-A launch, release PTT / CW, KN900 will automatically switch to VFO-B receiver;
When the current in the VFO-B launch, release PTT / CW, KN900 will

automatically switch to VFO-A receiver;

Note:
As KN900 launch low-pass is to use relay control, so I do not recommend that users use two different bands
Different frequency transceiver functions.
When using automatic key feature when working different frequency if needed, please confirm the two VFO mode of operation are
CW.
B 18/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Use automatic key function
KN900 includes automatic key, auto key in accordance with the standard 1:3 ratio to issue the corresponding dots and dashes.
KN900 automatic key functions used in two modes
One is the relatively early automatic key way, each time you press a button, it will automatically send a corresponding signal point plan,
If rapid succession pressing any key, it will automatically be too late to send key operation in order to save up, and then
The point designated sequentially transmitted signal. In this mode, press and hold a key down will only be sent once the signal. This mode KN900
Is defined as KEYER-NORMAL mode.
Another automatic key way is to hold down a key, the KN900 will send this key represents a continuous signal when it is released
When you stop sending. In this way many times for a quick press also has a memory function, it will automatically be sent too late
Send key operation saved, then turn sent. This mode is defined as KEYER_FAST KN900 mold
Style.
To use KN900 automatic key function, you need to follow the following steps:
Repeatedly press the DIS button to adjust the second line of the LCD display characters shown below:
SPF K-O RIT
At this point, press the F2 key, the key will automatically switch between the various states,
KN900 now live automatic key work status display on the LCD at the second line of the eighth character.
When the display character O, it indicates OFF, KN900 automatic key in the closed state;
When the character N, indicates NORMAL, KN900 automatic key in NORMAL state;
When the character F, it means FAST, KN900 automatic key in FAST state.

Note: KN900 speed automatic keys can be hidden menu to adjust the specific adjustment method see KN900 adjustment menu
A brief description (ver01.05)
19/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Use UP / DOWN keys function
KN900 contains UP / DOWN key, UP / DOWN keys There are three functions:

In CW mode and automatic key feature is enabled in the case, UP keys correspond to sending a point;
In CW mode and automatic key feature is enabled in the case, DOWN keys correspond to transmit a program.

In any mode, and automatically shut down in case key functions:
Short press UP key is equivalent to the main frequency knob clockwise one unit;
Press DOWN key is equivalent to the main frequency knob counterclockwise one unit;

Press UP key equivalent continuous clockwise rotation of the main frequency knob;
Press DOWN key is equivalent to the constant rotation of the main frequency knob counterclockwise.

Trimming function using the receiver
KN900 with acceptable frequency tuning function, can be adapted to receive and transmit frequency QSO objects inconsistencies or
Certain other conditions. To use the receiver tuning function, you need to follow the following steps:
Repeatedly press the DIS button to adjust the second line of the LCD display characters shown below:
SPL-OFF RIT
Now press the F3 key will be received in the use of fine-tuning and fine-tuning does not use the receiver to switch between
KN900 whether receiving trimming function in the second line of the LCD can be seen,
When the RIT, it means receiving trimming function is not used;
When the display similar to the following characters, which means that the receiver using the trimming function.
+ 12 <
Above the display indicates the current VFO receive frequency than the frequency (LCD first line shows the frequency) high 120Hz,
Receiving and tuning frequency shown in the display is corresponding to the VFO frequency, that is, that the number on the LCD of the last 10Hz bit.
Contents shown above represent the following meanings:
+ Current VFO frequency is higher than the reception frequency, another possibility in the display is the symbol "-", which represents the current connection
Close frequencies below VFO frequency.
12 999 numbers or other small, representing VFO receive frequency and the frequency difference value, the unit is 10Hz. Namely
Receive tuning can be adjusted between $B!^(B 9.99kHz.
<Means now turn the main tuning frequency knob to change the frequency of acceptance, rather than changing the VFO frequency.
If you need to change the VFO frequency, you can press the F4 key to switch,

when <disappears, turn the live frequency
VFO knob can change the frequency.
21/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Check the signal strength
KN900 received signal strength can be displayed, the function of the S-meter.
To use this feature, you need to follow the following steps:
Long press the DIS button, adjust the second line of the LCD display characters shown below:
S | | | 1 | | | | | | | | 5 | | | | | | | | 9 | |
Character S behind the black bar represents the number of signal strength.
(Note: This feature is only temporarily qualitative, not quantitative be displayed.)
22/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Check the strength of the output power
KN900 to show the strength of the transmit power.
To use this feature, you need to follow the following steps:
The launch state, long press DIS key to adjust the second line LCD display characters shown below:
Po | | | | | | | | | | |
Po character behind the black bar represents how much the strength of the output power.
(Note: This feature is only temporarily qualitative, not quantitative be displayed.)
23/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Check the strength of the reflected power
KN900 can display the intensity of the reflected power.
To use this feature, you need to follow the following steps:
The launch state, long press DIS key to adjust the second line LCD display characters shown below:
Pr | | | | | | | | | | |
Pr characters behind the black bar represents the reflected power much strength.
(Note: This feature is only temporarily qualitative, not quantitative be displayed.)
24/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
View SWR (SWR) Size
KN900 can display SWR (SWR) in size.
To use this feature, you need to follow the following steps:
The launch state, long press DIS key to adjust the second line LCD display characters shown below:
SWR | | | | | | | | | | |

SWR characters behind the black bar represents the number of standing wave ratio (SWR) in size.
(Note: This feature is only temporarily qualitative, not quantitative be displayed.)
25/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
The KB-900 Option support (optional)
The only for the purchase of the KB-900 bandpass filter option of the user.

KN900 able to KB-900 option provides support, KB-900 is a 6-band narrow bandpass filter option, you can
To improve KN900 amateur bands in six major anti-jamming performance.
To use the KB-900 option, you need to connect BAND DATA cable, power cable, additional control lines and high-frequency signal lines.

BAND BAND cable and cable equivalent to the original, only part of the original BAND control can be connected in parallel.
Power cord from the control panel: specific location right in the volume potentiometer, transistors 8550 left vias.
Additional control lines from the microcontroller pin 7.
KB-900 should be installed in the transmitter low-pass plate TO RX IN and between on-board RX IN.

More specific instructions please refer to with KB-900 release published installation instructions.

After properly installing the 1.8,3.8,7, 14,21,28 This six-band reception, it will automatically use the KB-900 option
Not in the six-band reception, you will not use the KB-900 option, while using only original machine low pass filter.

If you do not install the KB-900 option, the program's application and the original exactly the same, no effect.
BG6AGB 26/27
Full mode HF transceiver KN900 Chinese Manual (to be revised edition MCU v01.05)
Update History
2006.08.26 software version updated to MCU v01.05
Add auto key function
Increase the UP / DOWN key function
KB-900 to increase the support Option
Improved S-meter display effect and signal response range
Altered the different frequency transceiver mode content displayed on the LCD

The following two brief explanation see KN900 adjustment menu description (ver01.05)
Hidden menu to adjust the direction of increasing the step adjustment menu
Auto-hide the menu key to increase the speed of adjustment menu

Thanks! I should have given you credit. My bad...

I do spot that I can overload the X1M when tuning to the broadcast band.

Cutting out the preamp helps sorta...

797. Digital modes - proof of concept

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-12 14:40:48 UTC
From: W3FIS
Topic: 797 Message: 797

Well, today's project (nice being retired!)is to start in on digital modes. I have a "spare" SignaLink USB interface that I was using on my Alinco DX-SR-8, so I will leave the internal jumpers set as they were, and fabricate a cable/pigtail to plug into the microphone jack. If I turn the TX gain back, that should effectively reduce the power so that I don't run full power on "key down."

I'll simply chop an Ethernet RJ-45 cable in half and connect PTT, ground, and microphone. Audio from radio into the "Speaker" jack on the SignaLink.

I can recover PSK-31 signals, and am now looking at WSPRNET. I got WSPRNET software to talk to the X1M and set the frequencies correctly. The ICOM 718 stuff works on WSPRNET.

On a slightly different, but related topic, when I put Spectran on the signal, I find that I get slightly different apparent bandwidths for USB, LSB, and CW, so I suspect that the BFO alignments are off.

Does anybody have a sure-fire protocol for setting that correctly? There was a discussion, but I have misplaced it.

Thanks!

73 /paul W3FIS

I just took a piece of red sign vinyl and stuck it on the tuning knob. My display was cocked a little to the side so while I had the front off I put in a piece of blue plastic on the display. Did you see that new Chinese radio has a built in stand?

Subject: [X1M_QRP-Transceiver] Re: A new X1M Platinum video

Indeed.

My X1M is still in the mail, however I have already purchased some brand new plain black knobs to replace the standard ones as soon as it gets here. It cost about $10 total for a few different sizes at the local Electronics store (Jaycar, here in VK).

OK! Good to go!

Rigged up the cable (DO pot the stereo plug, as things are a little tight in there with four wires!).

Can send and receive PSK-31, receive wsprnet (need to try to send). Radio controls via cat cable work fine.

PTT is VOX via the SignaLink USB interface.

DO turn down the TX knob a bit on the SignaLink USB interface to cut back the power on the X1M.

BTW, since you loose the audio on the radio when you plug into the speaker jack, I have a small Radio Shack speaker plugged into the AUX jack on the SignaLink to monitor received audio.

Moving right along!

Anybody try this yet??

A SignaLink USB digital interface is easily interfaced with the X1M. We have discussed CAT control, of course. The audio feed to the interface can be done with 1/2 of a standard RJ-45 Ethernet cable and a 3.5 mm stereo plug. DO pot the stereo plug for mechanical stability.

Hi Buddy:

Used to live in Philly (please don't hold that against me).

My math shows 9 by 9 by 3 5/8 ths. (actually not math, rather measuring out 230 and 90 and then re-measuring the length in inches)

Interesting rig but need a little more information before I cough up 400 + bucks.

Whoa! They claim 10 watts, they also seem to give a fair bit in the way of specs. And it does FM. They say up to 10 watts, then say up to 20, so what is it really? And a very cheap price. Very interesting. It ays nothing about computer control, however; am also somewhat curious about the front panel controls? Its dimensions would seem to indicate that it isn't terribly small, approximately 8"X8"X4", unless my math is way way off.

Howdy Bruce,

Well, I can't very well hold Philly against you, I mean, except that it's just a big ol' very busy big city…after all, I'm not really from here either (I'm from Texas).

Anyway, I reckon I was close enough. Just doing round conversions in my head. I agree though, I'd definitely need a bit more info to drop off and buy one, though I'm not terribly likely, except maybe as a cheap remote base to hang off an Asterisk box to play with. After all, I already have a KX3 and a K2, what else do I really need? Understanding of course that "need" figures nowhere into this at all.

I was using my HF9V in the back yard which works fine on the 450D and DX-70TH, so I don't think it was antenna related. I cycled the attenuation and preamp to confirm that was not the issue. When I did the reset, the keyer started acting up (lost half the paddle). Not sure if it was related, but decided I shouldn't progress any farther with this one. Something seems amiss with mine, so I spoke with Ed and he's going to exchange the one I received. Sending this one out today to him. Maybe try again here in a couple weeks when I get a different one.

For Chris or anyone else who may be interested. I have a nice condition Eico RF probe that is excess to my needs. By changing the internal resistor, it can be made to work with about any hi Z input voltmeter.
$24 shipped USPS.

Paul I also have a spare SignaLink USB here that is currently setup for a Kenwood TS-2000 . Did you stick with the Alinco setup for it ?

What band will you try WSPR on ? I can put a receiver and computer on and see if I hear you here , but you will also see any spots on the WSPR page , I am just curious to hear someone I know is using an X1M . Actually I think I can rearrange some cables here and listen to anyone running WSPR with the X1M .

Still amazing with 48 years of radio equipment on the various benches around here that I have trouble finding a good permanent spot for a radio because it is too small ......

I just got off the phone with Dale at Kight Radio. I told him about that Transceiver (kn920) $412.99 shipped. Well this is one of those to good to be true items. Dale said he inquired about the radio and the Chinese company asked where did you get that price, our price is $1200. He told them of the web site and they denied it.
Sorry about that [:-?] .

From: ChristopherG
Topic: 808 Message: 808

Using the short 4" CAT cable that I got with the X1M-P I simply bought a Db9 to USB cable. Works fine.

Make sure the CAT cable is plugged into the radio, and plug the DB9/USB Cable into that and connect to your computer.

Use the Icom-718 settings as recommended....Although I accidentally used a different Icom setting and the net-book still paired and connected with the X1M.

HRD controls the Radio nicely.

More playing with it tonight & Hopefully to make some contacts as well.

Check the new user manual file. There is our list of what works with HRD.

Got digital modes up and running today with a home-made audio cable and my SignaLink USB interface. PSK-31, wsprnet so far.

> Paul I also have a spare SignaLink USB here that is currently setup for
> a Kenwood TS-2000 . Did you stick with the Alinco setup for it ?

Yes, so that I could put it back on the Alinco without having to change jumpers. The Alinco requires me to feed audio in through the microphone jack, and get audio to the "Speaker" connection from the Alinco speaker jack. Ditto for the X1M, so just built the audio cable to match the already connected pinout of the SignaLink.

Just make your audio jumper cable match to the Kenwood, and save yourself some work. If the Kenwood has audio from the rig, then obviously skip that part. All you need is mic in, PPT, and whatever grounds are appropriate.

I have been on 20 earlier today. Copied 5-6 stations, no reports on me. I have a bit of a compromise antenna situation, and was reluctant to run on full power.

> Actually I think I can rearrange some cables here and listen to anyone
> running WSPR with the X1M .

That is correct -- just feed the audio into your sound card. Just upload spots, set % to 0 and in no-transmit mode for wsprnet software.

>

Yes, tell me about that. I have a re-purposed shoe rack (kit, Lowes, about $15) to hold my stuff. Put the X1M up at eye level to make it easy to see.

Hang on a sec.

I think someone’s confused here.

Because Kight Radio made the same comment, with the same price I’d add, on a very different radio. On the other radio, I forget the model number, anyway, *that* radio was a 100 watt radio with a full numeric keypad, computer control, etc. This one doesn’t have all that. Also, could be wrong, but I don’t think you can buy on Aliexpress for other than the stated price. Aliexpress holds your funds until you’re delivered the merchandise, or so I’mtold by people who have shopped there.

If you just want to LISTEN and report, plug the speaker from the X1M into the Line In on your sound card, and set up wsprnet software for no transmit and upload spots. You need to register with wsprnet.org.

holy cow, that was a fun read.
I get an impression that you can increase the over all output power inside
the unit, but you only have a range of 1-10 watts on the front pannel?

regards
Colin

Topic: 789 Message: 815

Is there a better link to the details of the radio ? I sure don't need and can't afford another radio , but it does look interesting that there may indeed finally be some competition for the FT-817 at a good price .

So far I am VERY happy with the X1M Silver (I guess Silver is the correct name now). The AGC can be a little difficult at times , but certainly manageable and rarely a problem . I am afraid to open it up and do any mods on it , so I don't do anything to void the warranty , but the AGC will be the first mod that I make .

Looks like they went to a lot of trouble in the firmware and display for the attenuator . I wonder if one day they will have a mod to actually have an attenuator .

I am including a meter in my home built filter box so I can see more of a transmit indication . It will also have my antenna tuner and an SWR bridge in it and still keep it all within the size frame of the radio so it is going to be an edge mount meter in my current plans .

For the price and size it is one heck of a radio and I listen to it constantly while I work in the shop . Have a couple of projects that just have to get done before I can really get some testing done on my laboratory bench and the spectrum analyzer and work on projects to go with this fine little jewel and it certainly is no toy and VERY well suited to all of my applications , including the ones in the experimental bands.

It will be nice when they get old enough that there are some non working ones out there , that "can't be repaired" and I can hopefully pick one up that still has good firmware in it , to be able to do some mods on . That may be a while though :)

From: Fred VE3FAL
Topic: 789 Message: 816

Charlie and gang:

Been trying to follow the threads but have been busy with a friend of ours who needs surgery this week and trying to spend as much time with him as possible.
What is the AGC issue?
Is it overloading?

Just curious, my radio should be here this week. Been playing with a K2/100 and KAT 100 tuner in some of my spare moments.

817. Re: [X1M_QRP-Transceiver] AGC issue

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-13 02:55:35 UTC
From: Charlie , W5COV
Topic: 789 Message: 817

Yes Fred , it is just on strong signals and with the volume turned up high . Doesn't happen a lot and usually turning the preamp off and cutting back on the audio will take care of it . If the attenuator was operational and not too large , it would likely eliminate a lot of the problem .

There was some discussion of some AGC mods earlier that were being used in the original BITX transceiver .

From: Paul W. Ross
Topic: 789 Message: 818

Please describe the metering system. I'm just using the "kick" from my SWR bridge in the "forward" direction, in comparison to full scale on CW key down.

I do find overloading on MW broadcast bands, but that is to be expected.

That will work fine and is what I am doing now . I do have a need to know the power output at times , so I know which attenuators to use . I plan on using an Analog Devices chip to have a power meter along with an SWR bridge . Some of my work is done using less than 1 watt , plus I may drive my 222 MHz. transverter with it

Yes the MW broadcast is the worst but I experience it too occasionally on 40 meters , where I usually leave the rig on when I am in the shack.

I just got my new X1M Platinum August 9. I see there is no S/N on it.
and I did hookup it up and see it did have 17 meter because it was on frequency 18.067 vfo and vfo b was 7.080.out but today I will try to make a qso on 17 meter. It is small but that is what I would like to take with me when I travel out west to my son's house.

Hi guys,

I am still waiting for my X1M to arrive, but has anyone tried selecting a newer Icom radio command-set than IC-718? Newer Icom radios support TX and RX switching via CAT. I am wondering if the X1M would respond to this?

Cheers,
Perrin VK3XPT

PRESS AND HOLD BUTTON F5 -- it will give S/N and build date. Pretty cool.

> and I did hookup it up and see it did have 17 meter because it was on frequency 18.067 vfo and vfo b was 7.080.out but today I will try to make a qso on 17 meter. It is small but that is what I would like to take with me when I travel out west to my son's house.

I am planning on taking mine to a local "Lighthouse Activation" this weekend. Z817 tuner, SLA gel cell, etc.

Unless you set menu item #11 for "open," it will only transmit on 80, 40, 20, 15 and 10 meters. If you try 17, there are likely serious spurious emissions, and you should put a filter in it. See the discussion in our User's Guide in the file section.

It would be useful if people could post review information on the X1M to either Ed's web site, eham.com, or QRZ.com.

Topic: 825 Message: 825

I apologize if I confuse some of the people on the group , but I bought my radio to use primarily as a basis for some work on the part 5 Experimental Frequencies and also the part 15 frequencies , and as such I don't always use it in the same conventional manner as everyone else.

However I am VERY active on the ham bands using QRSS and WSPR and have been for more than a decade on QRSS and since day one when Joe released WSPR .

I do not advocate anyone trying to use the radio outside of the 5 filtered ham bands , unless you have some really good equipment on your bench . In my laboratory , among my test equipment , I have a Tektronix Spectrum Analyzer and my equipment that requires at minimum an OCXO to be accurate , I have two Wenzel 10 MHz. commercial OCXO's and then they and the equipment including much of my transmitting equipment is locked to them as well as being GPS disciplined and that is piped all through my home lab .

However if you want to experiment with building filters for various ham frequencies , that are good for 10 watts , here is a good link to study : http://www.gqrp.com/technical2.htm It gives the values for ham bands . I have not even had time yet to see how the factory filters look and how far down they are at the specified points .

I would caution you to build up a simple breadboard transmitter and experiment with building some filters and using what equipment that you have , plus software that is available to evaluate the filter . You can even use your grid dip oscillator once again if you were building when that was a good and popular test instrument to give you some ballpark figures of your measurements .

I would NOT put them on your new transceiver if you are new at building and lack decent test equipment if you are looking to add the WARC or 160 meter ham band .

I am currently building a 4,000 meter transmitter (72.4 kHz) and will likely later this winter , when the season opens up , propagation wise , use the X1M on 1750 Meters (185.3 kHz) on the part 15 band . I am in the process of applying for a modified part 5 license to also use it on the 630 meter (proposed ham band) (472 kHz.) and part 5 experimental band and also for the 2200 meter band (137 kHz.) and possibly the BCB under part 15 . Power on part 15 bands is measured in INPUT power , so I use transverters to get on some bands to stay legal . There is also the 22 Meter part 15 band . Again CAUTION DO NOT TRY THIS AT HOME :) Unless you have the correct equipment to work with . I just wanted to make it quite clear I am a designer and experimenter , but am using the radio as

it came from the factory at the present time since I have transverters that I can use for all of the experimental bands without getting off of one of the 5 filtered bands as it comes from the factory . I am probably using it more conservatively than most any hams are .

QRSS is quite popular on most bands and almost shares the "watering hole" frequency with WSPR stations . So you can easily watch both of them or operate them . 20 meters is the most popular band worldwide with 30 meters as the next most popular .

The most popular program for decoding QRSS is a program called ARGO , and can be found at this link : http://www.weaksignals.com/

I do plan on ending up with a filter box to go with the X1M if I can get a decent looking signal with my filters . It is the perfect rig for those of us that like to experiment too and I have now had some inquiries from my fellow experimenters , that are about 99 % ham operators , about the rig and there is a good deal of interest in it .

I hope to one day be able to pick up yet another X1M that I am not trying to keep factory perfect to use for my tests and experiments , but my budget isn't quite up to buying another one yet :) Seems I still have some Doctors that need new homes built , and pharmacies and hospitals that need to add on , due to my health and medical issues so they are getting all of my spare radio budget right now . <grin>

Sure won't hurt anything for you to listen on the other frequencies and the filter article should help some of you better understand the need for nice clean signals free from spurs on the frequency ranges not covered by the 5 bands that the radio comes from the factory with proper filtering already built in .

If we do suggest a frequency on each of the 5 bands , I will monitor the best band at the time that I am on here and really enjoy working others with this great little radio . We need to spend a little more time away from the keyboard and a little more time on the air letting the people know about this rig and let them hear it in action . The more people that buy them the more experimenters we will find and the more that the factory sells the more attention they will pay to making future improvements and hopefully still keeping the price down .

Usual disclaimers , you try anything mentioned at your own risk , and I have no financial or any other interest , except being a VERY satisfied customer ....

Best 73 ,

Charlie , W5COV

Works like a charm. I tried it yesterday on 20 meters, after I had rigged up the audio cable to the X1M. Using SignaLink USB. Logged about 6-8 stations, but middle of the day. Nobody picked me up, but I had reduced power to avoid heating up the rig. Bad time of day, also. I was getting RF out, so just luck of the draw.

If you can't stand the mis-matched knobs, and in particular, the red on/off/volume knob, inexpensive 6 mm push-on knobs are available from Amazon.

See this:

http://www.amazon.com/gp/product/B00CQLORZ0/ref=oh_details_o00_s00_i01?ie=UTF8&psc=1

They carry others, if these are not to your taste.

The filters from "Kits and Parts" might suffice? They are cheap enough, I would think, and unless you are running them hard, should handle the power of the X1M?? I am thinking of doing one for 30 and 17 meters. They sell a "dual" board.

What do you think??

This:

http://kitsandparts.com/univbpfilter.php

or this:

http://kitsandparts.com/bpf2.php

Put it in a metal box with two BNC jacks and a DPDT toggle?

The filters from Dietz work just fine . Just built one of his 5 watt flying pig rigs a couple of months back that is 5 watts . I also use one of his filters for my 10 meter beacon .
Good reliable person to do business with . I met him at a hamfest 10 or so years ago and have been doing business with him since then . I keep a good selection of toroids on hand and naturally good quality capacitors to handle the RF voltages seen even at 5 watts and ones that are carefully matched when I build filters .
That is a good way to go and a ham owned business that supports QRP.

The 9.5" x 4" piece was cut for me at a local hardware store. It cost $1.
I clamped it between some aluminum angle in my hobby vice and used a hot air
blower which is a lot hotter than a hair dryer. After a few minutes it just
folds over and hold it in place until it cools.

New version up today. We find that the memory actually supports BOTH the values of VFOa and VFOb, thus, you can store splits in memory, if you wish. This effectively gives your 64 memory storage locations, in pairs, not the 32 we originally thought.

We are on dangerous ground here.... My XYL said "what do you need one more radio for." I commented about the number of pairs of shoes in her closet. I am now sleeping on the floor with the dog....

We are all going to likely spend in excess of $300 for goodies for this rig....

Platinum is "Bo" and Pro is "Qin"..

Platinum is more like Gold in their translations or closely tie in together.

Now depending on the dialect and of course if it is Mandarin etc...

There are several simple little single transistor circuits out there for switching (for automatic computer PTT from the software) if you have just a small number of cheap parts on hand to build an interface with . As always when working with computers and radios it is nice to use isolation transformers or other isolation methods to help prevent ground loops . Not absolutely needed to experiment with , but good building practice , especially if you are going to be doing a lot of interfacing . Also keep a few toroids on hand to help with any RF and other interference problems that you might have , that are from another source besides the radio .

Make sure with WSPR that you are also running a good time updating program , since transmitting and receiving are fairly critical on timing for being synchronized with the other stations around the world . I personally use http://www.thinkman.com/dimension4/

Since the X1M doesn't have VOX , you can do a really rough transmitting test for WSPR by having your computer speakers turned up so you are hearing the WSPR tones when your program is transmitting and then holding your microphone in the area of the speaker and keying the microphone yourself .
Several cautions doing this . Don't EVER run ANY high duty cycle digital mode at anywhere near full power !!!! On WSPR use your audio level to set your power output since it is SSB , Upper SideBand (USB) in this case . Since the microphone gain for the Pro (I guess the correct name for this batch of radios , because it is what is displayed in my firmware too) , you will have to control your power output from the radio on digital modes using sideband , by adjusting the audio levels out of your sound card .

AGAIN if you test with manual keying and are using 2 minute WSPR cycles , remember you will need to pay close attention to your clock especially on the start time for transmitting . You also need to let it run through a complete cycle because if I remember correctly it looks at the time for its internal updates on even minutes .

This is another possible business for some ham who has cable making equipment , to make the interface cables to go with SignaLink , Bux Comm , West Mountain Radio and a whole world of hams and other companies that make and sell interfaces , some out of their garages , but nothing wrong with that . Could even build a simple cable set for the "Pro" and maybe even use a small enclosure and include a small VOX unit . So many possible accessories !!

A very good electronics tech making cables or interfaces in their garage or shop , using high quality components , is likely to be as good and

probably better than many that you can buy from some bigger companies .

USUAL DISCLAIMER . NOT RESPONSIBLE FOR WHAT ANY USER DOES . IF NOT DONE CORRECTLY COULD DAMAGE YOUR RADIO . SINCE I DON'T KNOW YOUR LEVEL OF EXPERIENCE OR ABILITY , THE INFORMATION PRESENTED IS UNDERSTOOD TO BE "FOOD FOR THOUGHT." IF YOU USE IT YOU DO SO AT YOUR OWN RISK !!

860. Shutting Off

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-14 19:29:05 UTC
From: ballardian36
Topic: 860 Message: 860

Hey all,

I was playing with my replacement x1m over the weekend and was having shutting down issues. It is the original model but while just on recieve the unit would shutoff and then not come back on for a few minutes. Other radios would power off the power supply just fine. I think it was after the first time we called CQ a few times but I don't think I trasmitted any more than a total of 60 seconds and not contigous at all. Not a great ratio for to actually use as a transmitting radio!

This same unit with this same power supply ran just dandy on recieve for a few hours a few weeks ago. It sounds like overheating to me and I swear there was a thread about that exact problem... but I can't find it. Anyone have the same problem and/or know where that thread is? I wanted to try a few more things before I contacted Ed....

Thanks,
-Chris

Has anyone used a small amplifier with their XM1? The noise level on 40 meters has been so bad lately that 5 watts won't do much.

862. Re: X1M & WSPR

Topic: 829 Message: 862

1. Fabricated jumper cable to go from SignaLink to X1M microphone in. I am using a SignaLink USB that I happened to have configured for my Alinco DX-SR-8, so the connections on the RJ-45 correspond to the microphone connections on the Alinco. All I needed was the two grounds from the Alinco configuration, Microphone, and PTT. I cannibalized a spare nice and flexible Ethernet cable, and cut it in half (now have a pair of 3' pieces. Used one). I used the 3.5 mm stereo plug shipped with the radio, as I already have my keys and paddles set up for 3.5 mm stereo. Used a piece of heat shrink tube to make it more mechanically stable (wire clamp in plug marginal), and "potted" it with RTV silicon rubber. Plug into microphone jack on the X1M.

2. Connected the headphone jack on the back of the X1M to the "Speaker" input on the SignalLink. Use a stereo 3.5 mm jumper cable. There are nice short ones from White Rook key people.

3. Connected the SignaLink to my computer -- Acer Aspire One net book, Windows XP. SignaLink USB gets its power from the computer.

4. Hooked a Rat Shack auxiliary CB <gasp> speaker to the AUX connection on the SignaLink so I can hear my incoming audio, as plugging into the headphone jack on the back of the X1M disconnects the internal speaker.

5. Fired up computer and Ham Radio Deluxe. Set for Icom 718, set sound card to your external USB card. See the SignaLink documentation (RTFM....) for particulars. Radio can now be tuned with HRD. Also, read and understand jumper connections in the SignaLink. It works fine with any radio that doesn't have rig control, such as my Alinco. I actually have to push buttons on the Alinco, though I have made extensive use of presets.

6. Activate DM780 for digital mode. Wsprnet works fine, as does JT65-HF. See our "User's Guide" for what works with the Icom configuration. All that counts.

7. Set TX and RX, Delay settings on the SignaLink. Keep the TX level down, as this will determine the signal level output and RF output on our SSB transceiver. I want to be gentle with it. Remember, most digital modes are full "key down." I used my SWR meter to get a feel for how much power I was getting out. I use <another gasp> a Vanco SWR-1 "CB" SWR meter which works on 40 meters and above.

Other than the cable fabrication, it took longer to tell you about it than to do it! <grin>

That does it -- maybe 3/4 hour effort along with a second cup of coffee a couple of days ago.

Also PLEASE check the new User's Guide. We found out some interesting stuff on the use of "splits" and memory storage. You really have 64, not 32 memory locations, but in VFOa/VFOb pairs. Pretty cool.

My reading of the circuit diagram for the X1M suggest that there are small RF chokes in all the input lines, including the "ground" for the key, headphones, and microphone. This suggests an isolation transformer would be a good idea. I believe my SignaLink USB has isolation transformers. In any event, the SignaLink USB works fine. No funny RF problems (which I have with my 100 watt Alinco DX-SR8 when I do SSTV!).

WQ8S, I use my SCI-6 on all my hf rigs. Think two 600 -600 ohm transformers, one variable resistor, an optoisolator. The input comes from my computer's mic and speaker jack. The output is from my phone jack and mic jack on the radio. I can pick up the PTT off the serial or USB depending on the software I'm running. I run fldigi or 110A. So I added a PTT to my switch box that I use to go back and forth between my mic and computer. SIG Simple is good. 73 Mark

871. QRSS Reception

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-15 06:42:08 UTC
From: Charlie , W5COV
Topic: 871 Message: 871

I try to work on some feature of the "Pro" each day , since I am working on another project on the bench that is consuming a large amount of my time .

My Pro has been on in the receive mode all day today and it is past midnight now . The heat stays pretty constant pretty much all the time . When I put it on the bench I will be taking temperature readings also .

This evening I decided that since I had been extremely successful on 30 meters receiving plenty of USA stations along with a long list of DX stations , with WSPR , to switch to another mode that requires an even higher degree of frequency stability. I decided on QRSS3 .The antenna is a G5RV at 30 feet , currently without a tuner , since I am not doing any on the air transmitting yet .

It exceeded my expectations for stability and solid copy for hour after hour .

I set the rig on the 30 meter QRSS "watering hole" , 10.140 MHz. , mode set to CW , CW Tone on the menu , set to
700 Hz.

Software is ARGO V1 build 143 . It may be downloaded and used for free from : http://www.weaksignals.com/

On the HF bands the "standard" speed for QRSS is 3 , which means 3 second dits and 9 second dahs .

There is a lot of good information on setting ARGO up and using it on the home page . The basic setup is pretty simple.

Plug a stereo cable from the speaker out on the Pro to IN on your sound card

My basic settings for this test were
Radio Dial Setting : 10.140.000
CW Mode on radio
CW Tone : 700 Hz.
ARGO
Speed : NORMAL
Setup : Realtek HD Audio Input (my sound card in a machine running XP)
Real Time Input : Sound Card
Mode : QRSS3
Click the START button
There is a vertical bar on the left side of the screen . Adjust the radio volume control to keep this in the GREEN and try to keep it out of the RED

Do not check the Save to WAV file box until you understand its function completely

You should see lines begin to scroll across the screen from right to left . If you have the radio tone set to 700 Hz. on your radio you can scroll the right side bar until 700 is near the center vertically . Not really important , but it will make your center frequency 10.140 MHz. You will see short and long lines scrolling across the screen , these represent the dits and dahs for regular CW . There are several modes used on this frequency but those will be the true QRSS signals. You will also see shifted lines usually about 3 Hz. apart , this is called DFCW or Dual Frequency CW and the pattern represents the dits and dahs again in regular CW .

I am not very good at explaining things , but I think this should be enough to get you started watching QRSS .

I have NOT tried to transmit QRSS , since it is a very high duty mode , and until I get the courage to open up my radio and start looking at making changes , I will not be transmitting QRSS , until I find a way to adjust and lower the output power . Normally QRSS HIGH POWER , is 1 WATT INPUT !!! You will copy stations from all over the world many of them running in the 100 mW to 500 mW output power . This is a VERY efficient mode and very narrow , so you can have a ton of stations in a single 1 kHz. segment .

I can add more later , if you need help and also introduce you to some software that is pretty awesome for QRSS and other weak signal modes .

Until I can figure a way to safely lower the transmitter output power on the Pro , I will next be trying to decode QRSS on the part 5 experimental bands . Here we will find QRSS30 , QRSS60 , and on occasion QRSS120 . QRSS120 is rarely used and the slower dits and dahs we get to , the more stable the frequency has to be , so even QRSS30 will be very telling on just how stable the receiver is .

Hope I didn't confuse you too much .

Best 73 ,

Charlie , W5COV

How about just cutting back the signal to the microphone? This is a SSB rig, so output is proportional to input signal level. On my SignaLink USB interface, I just reduce the TX level, and not the reduction on the RF level on my SWR meter.

Warmth wise wen it runs it doens't get that hot on the outside to me. It seemed a reasonable temperature for a small enclosure and circuitry. I was able to run mine for like 6 hrs recieve once and never did I feel like it got to hot and it ran just fine. It was only this past time (2nd time really using it) that I did key up at all and then only for a callsign or two really-- and it just shut off while sitting there. It is acting like a temperature cutoff -- but from the outside there is not indication of that.

Hi Perrin,

I didn't try a new rig but I did go through and manually test/map out most of the commands of the Icom-718 set. My results are that the rig doesn't even support the whole Icom-718 command set so I doubt that it will support anything above it and especially as fancy as TX / RX switching.

You cab find my original thread here:

http://groups.yahoo.com/group/X1M_QRP-Transceiver/message/430

I don't admin the Pro/Platnium version so it is possible that has been upgraded.

When I first got mine, same things happened. PANIC mode! Did a general reset, and now works fine. At one time or the other, I have had to do general resets on almost all of my radios that have an embedded microprocessor. FT-60R, Alinco DX-SR8, FT-817ND.

Since the general reset on the X1M doesn't reset the memories, not a big deal. The only parameter I have found useful, thus far, to fool with is the keyer speed.

884. Radio shack part numbers for quick but more expensive power cord $18US

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-16 15:55:33 UTC
From: jeffluszcz
Topic: 884 Message: 884

Hi All,
My X1M Pro came in the mail yesterday late in the day.

I was looking to quickly get the radio on the air but didn't have my soldering setup pulled out so I went to the local Radio Shack and pick up a simple power cord.

I got the two following items which made a single power cord:

Enercell Car Power Adapter part number 270-042 (M-tipped, center pin pos, cigarette lighter car cord)
Enercell 270-040 Car Power Plug (terminal clamps to cigarette lighter female)

The cord ends up looking like this:

[12V Astron Power Supply] Terminal Clamps -> Cigarette Female -> Cigarette Male -> M-tip

The package for the M-tipped cord didn't mention the polarity so I tested it with my multimeter, you should also just to be sure.

Regards,
Jeff N2TIQ

I believe the early models only covered 3.5 to 3.9 MHz.

The new Pro model covers 3.5 to 4.0 MHz.

They changed the filter range for the USA bands .

If it has just showed up as a change in the "new" manual , then Paul
must have found an error and updated it to correct the information .

Updates on the manual are a "work in progress" and subject to change ,
so it is a good idea to check the latest manual when an update is posted
on the list .

Hello everyone!!!!

Just got my X1M today.
The audio is very low with headphones or built in speaker.
I've tried to do a reset(14.RST ALL;0 or 1)
When it asks "reset settings" I select "YES" turning the VFO
then I press the VFO once but nothing happens.
Is this a general reset? Is there any other reset?
Am I doing right? I mean is this the right procedure?

If I'm in absolute silence I can hear the speaker with the volume at max five o'clock, if I press the MUTE button I see the "X" over the
SPK but it does not mute. No difference whatsoever.
The beep is loud when I turn on the radio so it's not the audio amp.

I would appreciate any help

Thank you

Just worked Sandy Hook , New Jersey Lighthouse on 20 meters (N2MO) . (14.265)
Conditions pretty marginal to the central US from the East Coast , but got a 5-6 report .

But good start worked 1st one on 1st call.

I just ordered mine last week for an emergency radio. I am looking forward to using it portable and in case of zombies to coordinate attacks. Lol.

Just curious what people are using for autotuners and what is the max swr that this little rig can tolerate without damaging it. My antennas are mostly resonant at home but portable is always another story of compromise.

There are a couple of contests this weekend as well as all of the lighthouse activations . Perfect weekend to be playing with transmitting and receiving !! I am a night person anyway and I plan on being up pretty much all night or as long as the band conditions allow .

The 4.5 watts output , makes it one of the top of the line "Cadillac" QRP radios .It is as good as ANY QRP rig on the market today for a transmitter . Right now I am having a real problem with the internal keyer , so I am using an external keyer on CW .

Right now there are many stations literally begging for contacts to add to their scores . I have been on 20 meters and the band is in great shape at the present time . There was a SID event today that about killed everything here on all of the bands for a couple of hours .

Many DX stations are starting to show up on 20 and "should" continue to get better after dark , as will 40 and 80 for sure . Get on there and start adding up the contacts !!! Wonder who will be the first person to work all states (WAS) using the pro , with any combination of modes or bands ??

Also many DX and also USA stations will take time out to work a QRP station so on phone and you are calling someone don't be afraid to announce that you are running QRP . Some will take breaks from working all of the stations calling them and just work QRP only stations for a period of time every so often .

I plan on giving the girl a good workout this evening and hope to work another station running a Pro .

It will make you a VERY good QRP transceiver to use , instead of always leaving it on hot standby for the Night of the Living Dead , zombie creatures :)

I have used it with my LDG auto tuners and it works fine . I also have an MFJ manual tuner , plus a couple of home built tuners and it loads quickly and easily even to high impedance antennas that I have around here for the part 5 experimental bands . I did use a couple of different baluns to get as close as I could guess on the impedance ratio that I needed before I tried the tuners .

Most modern radios from anyone begin to get unhappy fairly quickly at anything more than a 3:1 SWR .

From: Charlie , W5COV
Topic: 903 Message: 903

This might save some of some headaches later on .
Keep you a notebook handy to make notes in for the actual operation of your X1M PRO and to also note any problems and what you were doing when the problem showed up .

Also I would STRONGLY suggest that everyone access you SYSTEMS MENU and record the present values currently stored for each item in the list.

This will allow you to restore these values in the case they get changed for some reason .

I would like to suggest the following SSB frequencies for all of us to monitor with our X1M's while we have it on and are not engaged in using it for some specific purpose . Kind of a "watering hole" for we owners to meet each other and discuss our rigs and get to know each other better .

This is just a very rough draft proposal and if you have a better suggestion PLEASE share it with the group .

75 Meters LSB 3.895 MHz.
40 Meters LSB 7.210 MHz.
20 Meters USB 14.325 MHz.
15 Meters USB 21.290 MHz.
10 Meters USB 28.510 MHz.

Since I don't know where everyone lives , I will likely spend a lot of time listening on 40 and 20 meters , depending on conditions and time of day .

Perhaps we can eventually get down to one or two sessions a week at a specific time and frequency that works the best for the largest number of people involved.

I live right on the Oklahoma / Kansas state line . I can quite literally see the buildings over in Kansas from my back yard . I live in the Northeast Corner of Oklahoma .

Hope to be on 30 and 17 meters tomorrow with my PRO .

Charlie , W5COV

Charlie,
Thanks for the suggestions. I will try to monitor those freq's when I'm in the shack.
Quick question for you: You mentioned 30 & 17 meters - two great bands. How do you do that with the X1M?
I know to unlock the transmitter, but are you using external band-pass filters, or just a good sharp antenna tuner, or what?
Please let me know. I should be receiving my rig early this coming week.
Thanks in advance and 73!
Ken, W1KRT

20 Meters USB 14.325 MHz.
15 Meters USB 21.290 MHz.
10 Meters USB 28.510 MHz.

Since I don't know where everyone lives , I will likely spend a lot of time listening on 40 and 20 meters , depending on conditions and time of day .

Perhaps we can eventually get down to one or two sessions a week at a specific time and frequency that works the best for the largest number of people involved.

I live right on the Oklahoma / Kansas state line . I can quite literally see the buildings over in Kansas from my back yard . I live in the Northeast Corner of Oklahoma .

Hope to be on 30 and 17 meters tomorrow with my PRO .

Charlie , W5COV

Hi Terry and all,

Any success reseating the front panel? I just finally got my replacement one on the bench and had no output on any SSB bands -- haven't tried CW. I'm going to try and reseat the panel today but curious if anyone has been able to recover from a no output situation or have they all gone back to Ed or into the broken piles?

Was this while talking into the microphone or inserting a two tone signal ? SSB will show zero output when it is operating properly until there is audio applied .

907. Questions for the group

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-18 21:01:36 UTC
From: W3FIS
Topic: 907 Message: 907

I have pretty well figured out most of the parameters in the system menu. However, the following ones need clarification. Does anyone have a clear idea of what they do??

#06 - CW TDLY - QSK??

#08 - TXP TIM - Transmitting time set????

#12 - DDS clock setting - calibration fudge factor/countdown?

#13 - DDS MLT - likely "overclocking," but not sure.

Also, LSB is a little "basey" on 40 meters - I can apparently correct this with a change in #02 -- LSB BFO, by setting it to around 08998750 to 350. If you can copy a good LSB signal, you can fiddle with the setting as you listen.

Any insights would be appreciated.

I am looking at that nice 1/2 of an Ethernet cable left over from the audio digital patch cord project. I have a nice amplified MFJ-297 desk microphone. Hm...

Has anybody used an aftermarket microphone on the X1M? I do admit that the desk microphone is gross overkill, but...

This whole thing is getting entirely out of hand... <grin>

I have tried 2 computer headsets now and a Kenwood MC-60 amplified desk mike with mine during testing . All work fine . The headsets have the advantage when I am doing actual operating so I can type notes and use my logging program at the same time .
The MC-60 sounds a little better with the base in my voice . It also has the advantage of being able to adjust the mic gain without getting inside of the radio .
I built a very small test box so I can test more microphones . I can switch impedance easily however I need to with my little box. I have a D-104 and a Shure 444 sitting there ready to test , but a couple of other "accessories" need to be completed before I play with any more microphones.
Get the soldering iron out and give it a try Paul !!
I had to drop down to 7.208.5 and have had a nice clear frequency all afternoon . I did make one contact with Steve , KU4IU , he is located in Alabama , and we chatted for about 10 minutes . We were both running dipoles at about 30 feet , but he was not running an X1M .
lol Paul , I am probably the worst offender at not really needed accessories and overkill for X1M projects . I am thinking now that if I EVER finish experimenting with this beautiful little rig , that it is likely to end up in a console , kind of like the CPU on a computer , but instead the heartbeat of a great little low band regular ham station setup , with every little accessory you can dream of .
Right now there is TOO LITTLE TIME to build everything I want to end up with as accessories !!!
Guess I am going to have to start saving my pennies once again to buy another one of these to use like I had planned on . I have a travel trailer out at my sisters farm , that I often spend time at to escape the boring life of an old bachelor , that is often home bound .
This was the perfect sized rig , with an external filter box for the other 5 ham bands to leave in the trailer and I could leave it out there all the time and not be too concerned if it did happen to get stolen .
(That isn't too likely , since my sister has a new home she lives in there , very close to where the travel trailer is parked)
Looks like 40 is starting to hear some broadcast stations this early in the evening . May have to find a different frequency .

Definitely on the project list for tomorrow then.

I have a nice boom microphone for Skype, so might very well consider using that for the X1M as well. Just need a couple of bits and pieces from Radio Shack for that. I do like having hands free.

The MFJ-297 has a "lock" mode on one of the PTT switches. I also have a nice foot switch, so could easily rig that up. Put it all in a box...

Made a nice contact earlier on 20 with N4LEM in Cocoa, FL. About 745 miles. Moving right along. Gave me a 5x7 which is quite acceptable. No idea what he was using, but I could have lit up my toaster with his signal.

Gave it a try. No joy. The MFJ-297 screws up the bias network on the X1M. I need either a blocking capacitor, or an isolation transformer (like the SignaLink USB interface). Back to the drawing board/soldering iron.

Had a great time today working the Lighthouse's from my California QTH. Made it to Georgia, NY, Oregon, Washington St. and several contest Stations. It was a good test for the little QRP Rig. Mine is the original and works great. It came with a Buddipole delux package. Ready to try it on the Buddipole now.

Enjoy the Group info here.

914. My new X1M-Pro - Do I have a problem or 4?

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-19 12:29:45 UTC
From: pezcat19
Topic: 914 Message: 914

Hi All,

I have finally received my X1M Pro here in VK. It has been a loooong wait for me. All is/was not as good as I hoped, so I have a couple of questions (and observations) for the group:

Questions:

1 - Unless the RX signal is BIG, the speaker audio is VERY low. Listening to very weak signals is impossible unless in a very quite location. The receiver is VERY quiet - perhaps almost a little deaf when compared to my FT817. Is this normal?

2 - BIG RX signals are louder, but they "clip" and break-up if the volume control is set too high (roughly 3/4 or higher) - Is this normal?

3 - LSB mode was unusable out of the box. It sounded so bad that you could not actually understand LSB signals at all. IF Offset default was 08999850. I have adjusted this to 08999150 and then set LSB and USB offsets accordingly. It is better now, (all modes "work") however I have lost some of the audio "highs" in both USB and LSB modes. Is this normal?

4 - I can not hear a filter relay click "In or Out" for 10M band. Is a relay supposed to engage for 10M filters?

Observations:

- The internal speaker was loose - Now fixed with some hot melt glue.

- The LK/SYS button was very intermittent. I cleaned the contact with cleaner and now it works well.

- The LCD was not straight. I have re-aligned this and it looks good now. (protective film was still attached to internal LCD screen - I have removed this now and the screen is super clear).

Any advice and comments regarding my questions (i.e - is my radio faulty?) would be appreciated!

Thanks and 73

I was making some lighthouse contacts on my Atlas 210X, as well as some NA QSO Party contacts this past weekend, and switched the antenna over to the X1M (early model). I worked 2 stations in Texas on 15M. Got great reports, including a"great signal for QRP". This was with an end-fed wire antenna, and a 9-1 UN-UN, hooked into my base tuner, not the tiny Emtech I usually use. Kind of funny though, that in this configuration, my tuner is 6 times the size of my rig.

I also confirmed again with some quick experimenting that you REALLY DON'T want to operate these outside of the filtered areas. Lots of unwanted signals coming out. I'm thinking of making a couple of low pass filters for 17 and 12.

I picked up a used foam case for $1 at a yard sale, and now have it set up to hold the radio, tuner, antenna wires, etc. Works well, and is about the size of an old cassette organizer. For now I'm still operating from the car battery with a long 12V extension cord. Hoping to get some sort of battery solution in place that will also fit in the case. How is the new model with low voltage? The receiver on the original model starts to squeal with anything below 11.5 volts.

As for your battery, I picked up 2 12 volt 6800mah Li-PO from ebay for $21 each. They are small and measure 2.5 x 4 x 1 inches. My solar panels get here today so I can be ready for a Zombie Attack.

Glad to hear another person making great contacts on their X1M. I also have one of the early ones and love it. I have made some contacts on 17 and 12 with great results, I just turn the preamp off. Check out my QRZ page log. All contacts in my log are only for my X1M. Most are DX with a ground mounted Butternut verticle antenna.

"I just turn the preamp off"

This isn't helping the issue at hand. The radio puts out a rather nasty spur about 10Mhz up from your transmit frequency (in addition to others) when you're outside of the filtered areas. The filters you hear click in and out are not the same thing as the preamp. For 17M, that means you're putting out a rather strong signal right in the middle of the CW section of 10M, and for 12M, you're potentially interfering with local fire call frequencies.

The preamp effects receiving only, whereas the bandpass filters that click in and out for 80, 40, 20, 15, and 10 are for transmit and receive.

Hi Gang,

Do you have any ideas for me?

I have made some successful contacts today, but the Audio/Volume issue continues to be a problem for me. Workable "strong" signals distort and cut out (clip) if the volume is too high (at above 3/4 scale), which is right where the comfortable listening volume would be on my rig. This means I am constantly needing to run a lower volume than I would like, and I have perfect hearing (I can't blame my ears)!

As I mentioned in my first post, weaker signals are extremely quite and today I was unable to hear some stations while working from the outdoor coffee table, due to the regular 'ambient' noise of the outdoors!

I would love to know if all the X1M's behave the same, or If I have a problem with the audio stage.

Thanks again,

Perrin VK3XPT

I sent my first unit back for replacement after I experienced the same issue, although when I did the general reset the keyer stopped working properly. Ed sent me another unit which I received yesterday and it has the same audio issues. I'm assuming now that this is by design since it's lacking any AGC on the audio side. I didn't realize that it mattered that much, but apparently it does. I was hoping someone has a small circuit that can be put inline with the audio out to compensate for this? Or if there is plans to fix this in a firmware update on the rig. Any amount of AGC would help. As of now, I don't know how you would attempt working any weak signals or fading signals without giving yourself a workout on the volume control. Would love others opinions on this as well. Would hate to think that this is a paperweight.

Hi Bill,

Thanks for the info. Sorry to hear you are also having issues. Did yours clip and cut-out on strong signals too? I find this the hardest thing to deal with, as when dealing with a strong signal with QSB, it can be a real challenge keeping the volume loud enough to hear, and at the same time, not so loud that it clips/ cuts out...

(I would rather fix my rig than have to send it back to the USA from VK, as shipping from here is not cheap!)

I am keen to hear how the other X1M-PRO (Platinum) users are finding this. Please let us know!

How is it with a set of headphones ? My audio is so low without an antenna you barely can hear any noise at all from the speaker with your ear laying on the speaker . I do have to use it in a quiet radio room and the volume is increased enough to be able to listen to it without using full volume.

The clipping problem may be worse at your location . The lack of AGC causes distortion at high volume with strong signals . You may have to turn your preamp off . A little manipulation of the controls and you can usually receive pretty well with it at a decent colume as long as you do not have much , if any ambient noise .

It may get better if you go through an alignment of the controls on the menu . Some settings are pretty far off from ideal when they come from the factory . A few of us have been working on trying to add ore information in the manual to aid in getting the radio more closely aligned .

Yours "may" be a little worse than mine , but it is difficult to tell without being able to compare them side by side . There really isn't any volume to spare and especially where ambient noise is high enough that you hear that too , contributing to the total "background noise."

I am a bachelor and live alone so most of the time it is quiet enough I can use it without having to use phones , as long as I don't have a TV or another receiver on at the same time . The lack of AGC here in the USA isn't too bad until you get on a strong signal in the AM Broadcast Band and have the volume cranked almost all the way up . Turning the preamp off "usually" will resolve this .

I'll play with mine a little more tonight and provide more feedback. I didn't try headphones since I was demoing it to my son, but will try that tonight. I really like the size of the unit and want to make it work for back country camping/hiking, but don't want to carry another 5 pounds in gear to accommodate some of it's shortcomings. I look forward to other's suggestions on what settings work best on the rig, especially how to fix the lame CW keyer. :-P

Hi Charlie, Thanks for sharing your experiences so far. Some more comments below:

Regarding headphones: It is "OK" with headphones, however the same problems exist. The same is true with an external speaker, although this does help increase the output (I will not be carrying an external speaker with the X1M, as it's small size is the whole point of this rig! :)

Regarding Clipping and the PreAmp: The PreAmp OFF makes the rig even quieter, but the clipping seems to occur when the volume is up past 3/4 regardless of preamp ON or OFF. With the PreAmp ON, I can get more audio output without clipping occurring (when compared to PreAmp OFF and a higher Volume control setting)... This seems a bit strange to me.

Regarding my Location and Signals: I operate SSB only, and I am having the clipping issues on "normal" SSB DX signals on the usual bands - 80, 40, 20 etc.

Regarding the Alignment menu: I have adjusted the IF, LSB and USB offsets as LSB was unusable to begin with. Apart from the problems I have detailed, it works OK now on these modes. However, I would look forward to more information on the other settings in the menu, and if these can help make the rig better...

Subject: Re: [X1M_QRP-Transceiver] Re: My new X1M-Pro - Do I have an audio problem?

How is it with a set of headphones ? My audio is so low without an antenna you barely can hear any noise at all from the speaker with your ear laying on the speaker . I do have to use it in a quiet radio room and the volume is increased enough to be able to listen to it without using full volume.

The clipping problem may be worse at your location . The lack of AGC causes distortion at high volume with strong signals . You may have to turn your preamp off . A little manipulation of the controls and you can usually receive pretty well with it at a decent colume as long as you do not have much , if any ambient noise .

It may get better if you go through an alignment of the controls on the menu . Some settings are pretty far off from ideal when they come from the factory . A few of us have been working on trying to add ore information in the manual to aid in getting the radio more closely aligned .

Yours "may" be a little worse than mine , but it is difficult to tell without being able to compare them side by side . There really isn't any volume to spare and especially where ambient noise is high enough that you hear that too , contributing to the total "background noise."

Hi Gang,

Do you have any ideas for me?

I have made some successful contacts today, but the Audio/Volume issue continues to be a problem for me. Workable "strong" signals distort and cut out (clip) if the volume is too high (at above 3/4 scale), which is right where the comfortable listening volume would be on my rig. This means I am constantly needing to run a lower volume than I would like, and I have perfect hearing (I can't blame my ears)!

As I mentioned in my first post, weaker signals are extremely quite and today I was unable to hear some stations while working from the outdoor coffee table, due to the regular 'ambient' noise of the outdoors!

I would love to know if all the X1M's behave the same, or If I have a problem with the audio stage.

Thanks again,

Perrin VK3XPT

Perrin,
Would you mind sharing your settings with the rest of us? I received my Pro yesterday and, like you, found LSB virtually unusable. I do not understand the functioning of the "IF Offset" and so far have been unable to determine the actual crystal filter center frequency. CW is okay, but one sideband or the other is way off. This is probably due to my methodology (minimal test gear): good strong AM broadcast signal and try to equalize the sidebands by adjusting Offset. But then the BFO adjustments come into play, and...
If you would share your settings, I would appreciate it very much.
Thanks, and have fun! I would rate the audio gain on the X1M weak, and lack of AGC very unfortunate, but it is a fun little rig to play with.

Could you share some of your setup and config there Fred? I hear the same signals versus my other rigs on the same antenna, so I think the receiver is fine. Audio levels from the same signal go from poor to worse as the signal fades below S5 on the other rigs. Signals above S8 are louder and above S9 begin to clip.

I got ya. I don't know if mine does this or not. Really don't have a way to receive a signal at 34Mhz. I will have check what you are saying on 18Mhz at 28Mhz. If the unit is putting out 5 watts, I wonder what it is actually putting out 10Mhz up.
Thanks
Mark

Several hams in my radio club are using little 1 inch cube speakers with their KX3's . The speakers have amplifiers built in. I'm playing with an original X1M that one of the other members loaned me.

I think they bought them at Radio Shack. I'll see if I can call one of them on vhf. Or e-mail them and make sure.

Been listening to W1AW most of the evening on 14.0475 and have the audio at about 10 o'clock position and plenty loud enough and no overloading.

Will try and get some video and put on website..

Fades do drop quite a bit but still can copy without any issues, very clear and clean signal...

Hi Ken, and the group.

I know this has been covered before, but here is my 'no test equipment' method for aligning the X1M Pro/Platinum, which resolves the LSB issue.

This will be a NON TECHNICAL procedure. Here we go:

First we need to adjust the IF Offset. I don't have the correct technical term for this, but what we will be doing here is "centering the IF Offset between the "sweet spots" for the USB BFO and LSB BFO" ... If you are having the LSB audio problem, then your X1M-PRO is most likely too far towards the USB end of the scale, putting LSB "too far away to work correctly".

GENERAL RULE: If you Lower the IF Offset by a value of -300, then you should also adjust the LSB BFO / USB BFO by the same amount (delta) of 300. If you adjust the IF Offset by any amount, and fail to move the LSB/USB/CW BFO by the same amount (delta), then the radio will sound off frequency.

If you are not sure on which way to go (+/-), or where to start, then here is what I did:

1 - Select LSB mode and tune to a known AM Broadcast band signal *before* entering the menu.

2- Enter the menu, and lower the IF Offset, say by -300 to start with (It seems that everyone has had to LOWER the IF Offset value to correct the problems).

3- Now go to LSB BFO and adjust this value (+ or -) by 300, and you will notice that in one direction, the audio starts to improve, and the rig comes "back on frequency / zero beats".

4- Now save and exit the menu.

5- Select USB Mode. Re-Enter the menu, and this time go to USB BFO and adjust this value (+ or -) by 300, and again you will notice that in one direction, it audio starts to improve, and the rig comes "back on frequency / zero beats".

6- To see if you are closer to the "magic number" or "sweet spot", exit the menu and while listening to the AM broadcast station, toggle between LSB and USB modes listening for any change / differences in audio between the two modes. The aim is to have them as close as possible, which by default was not the case.

7- Make changes to the IF Offset / BFO's as many times as you need to get it to the sweet spot. This takes a bit of time and lots of button pressing (I spent a good 30mins playing with different settings until I came to my IF offset delta of "-610"). If you make a mistake, simply do a reset and the default values will be restored.

8- For adjusting the numbers it is simple addition and subtraction until you get to the right spot. The same goes for CW BFO. You can simply do the procedure above on LSB and USB modes, and when you are happy, note the "difference" (delta) between you new IF Offset

value and the original, and apply this difference (delta) to the CW BFO. All should be well!

For reference, I ended up shifting the overall IF Offset (delta) by "-610", where LSB, USB both sound good and have similar "tone" and audio characteristics. Here is what I have ended up with:

IF Offset = 08999240 (default 08999850)
LSB BFO = 08998140
USB BFO = 09000340
CW BFO = 08999140

I hope that helps some members of the group. I apologize in advance for any assumptions I may have made, but his has worked very well for me. YMMV.

I am happy to hear any comments, suggestions and improvements the group may have. :)

Good luck! 73

I do not understand the functioning of the "IF Offset" and so far have been unable to determine the actual crystal filter center frequency. CW is okay, but one sideband or the other is way off. This is probably due to my methodology (minimal test gear): good strong AM broadcast signal and try to equalize the sidebands by adjusting Offset. But then the BFO adjustments come into play, and...

Using this guy's circuit schematic from Youtube video.
http://www.youtube.com/watch?v=5yhMOcpHS7Q
we can add an s-meter to the X1M.
The problem is where do we connect it to the X1M's AGC?
As far as I know the schematic available here is not complete.

Here is a video of my X1M with the audio issue:

http://youtu.be/0apKc2kc8GE

It would be great to see how this compares to other X1M-Pro's.

Regards,

Perrin VK3XPT

Just curious as I have received my X1M today whether or not I can connect this to an external amplifier. Sorry if this is a dumb question.

Pin 5 of the MC 1350 chip has an AGC line coupled to the output of the filter...

That's not what I am seeing from the on-line schematic. MC1350 Pin 5 is tied directly to the wiper on the RW1C pot. The top of the pot goes to Vcc and the bottom goes to ground. This sets a DC level to control the gain of the amplifier.
Is there a different schematic?

961. X1M Pro CW Transceive Problem?

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-21 15:35:45 UTC
From: w1krt
Topic: 961 Message: 961

Help! I've been working on my Pro (ROM info:Ver 1.00b USA, dated July 20) since I got it Monday. With the help others have posted here, I have gotten the LSB and USB to appear to be working FB. CW is a different story. With the I.F. Offset and both sideband BFOs optimized per advice found in this group, trying to set the CW BFO leaves me with two choices, neither of which is correct. If I set the BFO so that the receiver copies a signal (from my K3) set to the same dial frequency, then the X1M transmits 800Hz (or whatever "cw tone" I select) lower. Similarly, if I set the X1M to transmit CW on the dial frequency, it receives 800Hz higher. I have not been able to get it to transmit and receive on the same frequency.
In desperation, I tried the test again with the default settings, thinking I had managed to "optimize" the i.f. offset to the wrong sidebands. No change. The rig still will not T/R on the same frequency. Have I missed something basic? Are others seeing this behavior as well? Suggestions please. I really don't want to send the radio back (bad Firmware load?) but I prefer cw to SSB and don't want to have to use keyed audio tones in SSB mode to get the rig to transceive properly.

You are correct Dale. Now that I have downloaded the hi res schematic. I had been just reading the the data sheet for the 1350 and then looking at the board. Should be a way to insert some control there though.

Tried mine last night. While transmitting on 18.150 with my first generation X1M, I listened around 28.150 on my Yaesu and heard nothing. I have not experienced any of the problems that people have been posting here with mine that I got in April of this year.

I agree. One should only need to get to the AF before the volume pot, amplify, rectify and massage the DC with the appropriate attack/hang R/C's and the radio could easily obtain a 50dB+ AGC range. The hardest part is already there- the MC1350. It's a bit of a mystery why this was not done.

Hey Charlie --

Any chance you have or could take a screen cap of the output of the x1m on 17m with a sepctrum analyzer? I'm working on finding one local to do my own tests with but I'd love to get even a single screen cap to satiate my curiosity until then -- I'd really appreciate it :)

Thanks,
-Chris

I don't see why not. As I understand it, the "booster" amplifiers detect RF input and turn on, otherwise bypass the amplifier during receive. No actual experience, however.

Tokyo High Power makes one for the Yaesu FT-817ND. They say that it can be run "manually" for other low powered rigs.

http://www.tokyohypower.com/hl-45b.html

Around $500 or so. Frankly, for that sort of money, I would go for an Alicno DX-SR8. You can always use another radio...

Currently, my shack has the X1M, Yaesu FT-817ND, Alinco DX-SR-8, and for VHF/UHF, an Alinco DR-605. The three HF rigs are connected through a 4-way coax switch, SWR meter, and LDG Z-100Plus tuner to the antenna system. That 4th socket needs something attached to it....

I thought you wanted to transmit 700 HZ higher so you would hear a 700 HZ tone off set? On the little speakers I found out they're about 1" round. You can get them as pairs or single. They recharge off a USB port and some of them have cords that wind up inside. Mark

Frustrated, I tried the factory settings- the results were the same. If I tune the radio and hear a CQ on, say, 7030 KHz and answer it, I transmit on 7029.2. I expect the radio to send and receive on the same frequency. Reversing this case- if I call CQ on 7030, and someone answers me on 7030, he is zero beat in my receiver. I must tune to 7030.8 to hear the expected 800Hz audio. If the caller is weak or if I am using an outboard audio filter, I'll never know he's there. I've used a lot of radios in my 50 years as a ham, and I've never had one act like this. Either I've totally screwed up the alignment (and the defaults loaded in ROM are also screwed up) or the firmware is bad, either in just my radio, or a whole bunch of them.

Here is my understanding of how things should work: Assuming the Offset is adjusted to center the passband properly, if you select an 800Hz cw tone, the cw BFO should be adjusted so that a signal on the frequency your radio is tuned to (according to the digital readout) will yield an 800Hz tone, and when you transmit, either: 1) An 800 Hz tone modulates the BFO in LSB and yields a signal on the radio's dial frequency, or 2) the MPU shifts the BFO or some other oscillator by 800 Hz to yield output on the indicated "dial frequency." Using an audio tone to emulate cw with an SSB transmitter is not uncommon at all, but the process is normally transparent to the operator. Regardless of which technique your radio uses, if you transmit on a "dial frequency" of, say, 7030, you should be able to hear an answer ON THAT SAME FREQUENCY with a predetermined NON-ZERO beat note frequency.

Kapish Kapusta, noted that yesterday whilst vainly answering a loud CQ on 20 meters and he would not come back to me, generally used to that always running qrp but at least I get a QRZ or something, so turned the other rig on and heard him just fine, sent my call and I was not there, see the meter moving. So tuned a bit (and I have all my rigs set at 600hz, well low and behold there I was up 600hz.

Just a note, I have not done any of the IF OFFSET stuff as of yet, so will get to that after other additional tests are performed.

Just put the X1M (Ver II) on the bench, went through the menus and all offsets and settings are exact to the new platinum (PRO) version, however when I transmit on 14047.5, my other radio shows I am on that QRG exactly with my 600hz tone.

Well, there it is! Let us know how it works out. I have just fooled with the IF offset adjustment at this point.

Thus far, about 1/2 dozen SSB voice QSOs on 40 and 20 meters, and decent reports. I am in "Slower Lower" Delaware at Fenwick Island, and have made contacts into Illinois, North Carolina, and Florida thus far.

As to the audio issues, I find that on mine, at least, that the audio is a bit weak in the knees. If I have the radio on the desk, and I am essentially in line with the speaker, things are fine. If I put the radio up on a shelf at eye level, the better to see the dial, then it appears that the speaker is pretty directional.

Two solutions --

1. Headphones -- I am deaf in one ear, so this helps. (XYL says that it is selective... who knew?)

2. " Amplified Computer Speaker" - I have one around to use on the QRP rigs that don't have a speaker. I note that I can now turn the volume back, or NOT use the preamp, and a lot of the overload issues go away.

Your mileage will vary...

Paul,
Yes, having done the alignment, I find the audio in SSB is quite good, and more plentiful once the signals are centered in the i.f. passband. Imagine that! And yes, the speaker does seem very directional to me, too. I guess either external speaker or headphones will become SOP in the shack. No problem. Now just need to lick this cw thing...
Are you on in the evenings/night? I'm in New Hampshire. That should be doable if the QRN behaves.

974. CW Woes

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-21 20:31:30 UTC
From: Fred VE3FAL
Topic: 974 Message: 974

So for those of us who like CW I think we have come across a bit of a stumbling block or hurdle with the offsets, not only that the split function on the radio I have does not appear to work in cw, but was tested in USB and LSB and indeed worked.

This makes operating cw a bit of a challenge now, as stated my X1M Ver II transmitted where I set the VFO and was indicated on another receiver and frequency counter to be true.

Any others tested and tried????

Fred

VE3FAL

975. X1M ver II vs. Platinum

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-21 21:20:39 UTC
From: Fred VE3FAL
Topic: 975 Message: 975

Ok did some more testing between both versions and just uploaded a few videos' of the units both receiving WWV on 15 MHz and switching between sidebands.

Also did some Split comparisons, the old X1M Ver II did indeed work split on cw, but not very well, it takes a whole 2 seconds for it to switch between VFO's..it will then transmit on the selected VFO, the X1M Platinum however will not switch over in cw mode in split mode, I keyed for 10 seconds anticipating a switch and nothing. Works great in sideband mode however ASAP.

Regards

Fred

978. Issue when keying

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-22 00:08:20 UTC
From: KeithH
Topic: 978 Message: 978

I just powered my rig on for the very first time. I was pleased with the receive. Picks up signals extremely well, however, I get a tapping relay noise when i key the microphone into a resonant vertical antenna and it is not putting out any RF output. Any ideas? I just received this rig from Kight Radio on Saturday.

Thanks,

Keith

Hi Keith,

Have you tried a reset? Go into the menu, perform the reset (RST ALL: 1) and see if that fixes it.

The other obvious thing to check is your power supply (make sure it is able to supply at least 2 amps at 12V)

Good Luck,

Perrin VK3XPT

I would certainly suggest trying it into a 50 ohm dummy load . Kind of sounds like a little RF might be getting back into the radio .

It works fine if you push the microphone phono plug completely into the X1M. Initial impressions are extremely positive. Worked great with my 4btv on 15m with a local friend. I like this ascetic little rig. Feel like a real QRP ham operator now.

Just for good measure, and prior experience with QRP rigs, I have ferrite chokes on the power, keyer, and audio lines. An ounce of prevention...

I can generate enough RF in the house with the X1M to cause the "touch" switch on the china cabinet to light up, and the XYL's bedside light to go on (she is NOT happy....).

Now that I got it working I am extremely impressed with the receiver. It is actually very sensitive. I haven't worked any DX yet on it but I will keep trying. I have a good QTH and my antenna farm should do pretty good with this rig but I am even more excited to get started on some portable work with this super portable. Very pleased so far.

Another common issue Keith . Glad you discovered it . This is one heck of a radio .
It does pay to go to the group web page and go through the alignment procedure , if you haven't already . Very simple and just takes a few minutes , but it will result in hours of fun .
A year or so ago I made a wish list and discussed it with several of the QRP-L e-mail reflector guys about what should be included in a QRP transceiver and at a price that was decent .
This radio was almost too good to be true when I first saw it . It included most everything on my list and the price seemed just too good to be true .
This is the radio that the QRP community and newly licensed hams on a budget have been waiting for . Being "a high power multi mode QRP rig" was at the top of my list .
There are lower power kits covering fewer bands and usually CW or digital only , that cost as much or more than this fully operational transceiver .
With the near 5 watts output it is still QRP , but with this terrible solar cycle that is what makes it stand very tall above most of the kits out there , if you were a builder and wanted to spend the same money and still have to build the radio and maybe furnish the enclosure too. The "high QRP output power" DOES make a BIG difference !!
Add to that that I have never had better support after the sale with any other radio . I bought mine from Ed and he and the other dealers do just a great job.
Look forward to working you on the air .ENJOY !!

Somewhere I recall a discussion of a newer X1M rig- maybe the X2M?? Is there anything new on this?

I don't (yet) own the X1M. Is there room inside for a very small surface mount board that would allow for making use of the MC1350 AGC? I am thinking about 1/2" square PCB.

Hi Fred ,

I did get an FT-857D hooked up and was able to duplicate your problem . I don't have the answer yet , since I have several other things on my list right now . As soon as I can get to it I'll take a shot at working out a solution for it . Not promising anything ,but willing to try since I have an identical setup available to me .

My bench is filling up . <grin> I was in the middle of building a 4,000 Meter station , when my radio arrived and it is still on the bench too . I am normally an experimental band guy , especially any frequency lower than 2 MHz. and the season for those frequencies is quickly approaching . Nice thing is if the ARRL & FCC here in the states will quit messing around we should have at least the 630 Meter band like most of the rest of the world has had for a few years now and this little radio will let the guys build a filter and at least have the exciter or QRP rig that will already transmit and receive on that band .

This radio would be high power for me on some bands like 1750 meters , where I have been running 1 watt INPUT for at least a decade and have captures out to about 1,500 miles using QRSS and just a 50 foot piece of #14 wire vertically polarized for the antenna . The loading coil is a bit more of an adventure :)

Charlie,

I am new to QRP as another part of the hobby I am interested in. I once owned a KX3 for about a long minute until I discovered it wasn't working well no matter what I did in my mobile. It was just too expensive to keep as a backup to a backup.

I was still looking for a true portable emergency radio and began reading about this rig. I am impressed as I have it next to my K3 and my FT101E. It is a great little rig and worth the little over $300 I spent on it. I know it wll get a lot of use.

Space is pretty much at a premium inside of it Dale , but with the MC1350 already installed on the board . I "think" there is some room available to add AGC . For that to be already mounted on the board , I can't help but believe that they had plans at some point in time to add it in a later model , same with the firmware having the Attenuator , enable/disable operational , but no attenuator .

I think for now they are probably going to offer this stable version to help with their financing for quite a while , then I would not be surprised from these various clues that somewhere down the line they will add an updated model , but I think it may be a while yet . These are purely guesses and speculation on my part . I think a lot depends on how the sales go on this model they have quite a lot of money riding on its success from my impression .

Ed is a great guy to deal with and I think he will keep us informed of whatever he learns about their plans . Another reason I bought from a USA dealer , instead of the factory or a Chinese supplier , at least some of the money stays here in the USA and buying from Ed he offers super support and as up to date information that he can get .

I see Ed has a CW/SSB filter for sale now , that appears, at least in the picture , to be similar in size proportion to the radio.

After I ordered the X1M Pro , I decided I needed a new HT . Another GREAT PRICE from Ed and I love it too.

First 2 new ham rigs I have purchased in years and am VERY happy with both .

Keith ,

The biggest problem I had was finding a good place to set such a small radio !! Never had had that problem before in my 48 years as a ham . lol

Mine is on anytime that I am in the shack . I have always been a QRP fan even since my Novice days . It makes a better operator out of you , I think , and you certainly spend a lot more time on good resonant and efficient antennas and feedlines .

Congratulations on the DX . The sun is doing some strange things this week so I am looking forward to the ups and downs of working DX with the Pro this week .

I think the Hawaii QSO Party may be this weekend . Have to check times and dates to be sure . I would like to get them in the logbook with the Pro on every band possible , since it will probably be the best time all year long to find all the Hawaii stations on the air on all different modes and different bands .

Thanks Charlie,

Can you tell me the name of Ed's company or his URL? Any idea how long it takes to get a radio after ordering?
I am getting more and more interested in the rig.
Finally, are you active on 500KHz or just on 185KHz at this time? I too am looking forward to the quiet winter season on LF.

Space is pretty much at a premium inside of it Dale , but with the MC1350 already installed on the board . I "think" there is some room available to add AGC . For that to be already mounted on the board , I can't help but believe that they had plans at some point in time to add it in a later model , same with the firmware having the Attenuator , enable/disable operational , but no attenuator .

I think for now they are probably going to offer this stable version to help with their financing for quite a while , then I would not be surprised from these various clues that somewhere down the line they will add an updated model , but I think it may be a while yet . These are purely guesses and speculation on my part . I think a lot depends on how the sales go on this model they have quite a lot of money riding on its success from my impression .

Ed is a great guy to deal with and I think he will keep us informed of whatever he learns about their plans . Another reason I bought from a USA dealer , instead of the factory or a Chinese supplier , at least some of the money stays here in the USA and buying from Ed he offers super support and as up to date information that he can get .

I see Ed has a CW/SSB filter for sale now , that appears, at least in the picture , to be similar in size proportion to the radio.

After I ordered the X1M Pro , I decided I needed a new HT . Another GREAT PRICE from Ed and I love it too.

First 2 new ham rigs I have purchased in years and am VERY happy with both .

Somewhere I recall a discussion of a newer X1M rig- maybe the X2M?? Is there anything new on this?

I don't (yet) own the X1M. Is there room inside for a very small surface mount board that would allow for making use of the MC1350 AGC? I am thinking about 1/2" square PCB.

So stoked. Just worked Venezuela on 15m with 4.5W on my 4BTV. Now I am getting surprised. This could be the start of my QRP DXCC. I have worked QRP before with the KX3 so my total is now probably like 5 for DXCC QRP. So very stoked.

My LSB doesn't sound nearly as good as the USB mode. I am on 40m and people sound like they are all over modulated. Doesn't sound right. Plus the audio signals vary up and down.

Hi Dale ,

I thought that your name looked familiar . My last part 5 license expired and I let it , because they had only given me high power on 1750 meters .

Warren is going to help me get 4K meters through 630 Meters all on one license . He said they are allowing 10 watts ERP on at least 4K meters . Now I would like to see that station :)

The URL for Ed's company is http://www.importcommunications.com/

I am still active on all of the MF/LF groups and watch almost every evening especially now . The weather people say that we have had such a cool , wet summer here , that we are actually in the very early stages of fall . I hope to have my license approved before the season gets into full swing .

I have been using this Pro version for my 630 meter receiving and it is doing a super job of hearing and stability so far . I would sure like to find someone that I can hear that is running either QRSS30 or QRSS60 on 630 meters to look at it for long term stability on those modes . Being in the middle of the country has its disadvantages at times of being close enough to hear some of the really slow speed stations .

Thanks Charlie. I have always been amazed how well my 16M/80M Beverages work on LF- many times beating out my Flags and shielded loops. I'll have to see if ARGO is on my new netbook- if not I'll get it on this weekend. Is W4DEX still active on 185KHz? I was mainly listening on 500KHz last winter and did not get down to running ARGO screens on 185 or 137KHz. I also have my 15' EME dish back up and will be QRV on 23cM EME with 600W+ at the feedhorn. Too many interests- so little time.

WAY TO GO KEITH !! Sounds like we will all be chasing you for QRP DXCC with the Pro !!! Earlier in the week I had my sights set a little too low . I was wondering who would be the first to do WAS with it . Well if that Hawaii contest is indeed this weekend that is another DX entity .

You need to go through the alignment procedure , here let me look up the URL . http://groups.yahoo.com/group/X1M_QRP-Transceiver/files/Manuals/ <http://groups.yahoo.com/group/X1M_QRP-Transceiver/files/Manuals/>

Go to Aliignment - simple.pdf <http://f1.grp.yahoofs.com/v1/5IYVUiSQ0Ue53_Aspec976ZdQWk3ZuN2eysQ8m8KLa1LUIcO-vkVa9bT-iN0jPPlSzRd3GPu_Yw_BGjRfQniOQomSeWDzKhH/Manuals/Aliignment%20-%20simple.pdf>

They come from the factory needing just a tad bit of tweaking on the menus , especially on LSB . This will take you just a few minutes and it is well worth it for the hours of fun you will have once it is done and can easily work even more DX then and be right on . Doesn't take any test equipment .

See if that doesn't solve your LSB problem.

998. X1M-Pro questions. Keep it or send it back?

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-22 03:51:10 UTC
From: pezcat19
Topic: 998 Message: 998

Hi all,

I am trying to decide if I need to send my X1M-Pro back for warranty, or if I should keep it and work on it (mods, improvements, the fun stuff!).

If anyone can help with their results for the following, it will help me decide what I need to do. (Overall I am happy with the rig, but I need to know if the issues I have are common, or unique to my radio...)

1 - Loud (strong) SSB signals cause my radio to start clipping / breaking up when the volume control is set to approx 3 o'clock or higher. The audio is generally not very loud, even when the clipping is occurring. (see my video here: http://youtu.be/0apKc2kc8GE)

Some members have said their X1M-Pro's are similar to mine, others seem to not have this problem? I would like to understand this so we can look at the problem and resolve it if possible.

2 - Filters for 10M. My radio does not have a "filter relay click" for 10M. Can anyone confirm if this is normal or is it perhaps a faulty relay (or filter section) in my rig?

3 - TX Output power on 10m is between 3.0w -3.5W maximum (measured with multiple meters). All other bands vary between 4W to 6W. 10M SSB is my main/favorite band, so I would like to know if this 3.0-3.5W is normal, or if mine is a little bit down on 10M? (Perhaps related to question 2, filtering above?

If I can get to the bottom of these 3 items I will be able to decide what to do... (I am in VK and sending things back to USA is no fun at all!).

Thanks in advance,

Perrin VK3XPT

Dale I have the same problem , too many interests , too little time .

Dex is the main station that started the testing on 4K meters . He was off this evening because of a power outage , but is normally on 72.4 kHz. running QRSS60 and has been seen I know in Illinois .

My friend , Charles Wenzel , in Austin , Texas . has a grabber on there , but so far we haven't seen Dex in this part of the country . His grabber is : http://www.techlib.com/slm.htm

I know Dex also squeezed in some EME time , so he will probably be back on when you are .

Perrin ,

I would not want you to make such a decision based solely on my information and feedback .

After watching the video and reading your description on item 1 mine is very similar to yours . The addition of an amplified computer speaker goes a long way to resolve these issues . Until some AGC is added , I think the issue will pretty much be the same .

On item number 2 , there is no relay click when you change to 10 meters . I just checked again to verify that .

On item number 3 , I do not have any LF slugs for my Bird 43 watt meter . However this part seems absolutely normal to me . I don't know that I have ever owned an HF radio that did not have less power output on 10 meters than on the other bands . There is always the possibility that you could more accurately tune your filter , but even then I would be surprised if you gain more than 1/2 of a watt .

Those are just my thoughts and observations of my own personal radio and past experience .

Hopefully many others will give you their observations to allow you to make a better informed decision .

Hello everyone, I wanted to know in Italy there a distributor for x1m Platinum.
greetings

1002. X1M-Pro suffering from many of the same ills as original model

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-22 13:24:00 UTC
From: sbjohnston@...
Topic: 1002 Message: 1002

It is frustrating the new X1M-Pro units are suffering from the many of the same ills as the plain X1M. One of the most troubling problems is that units are being shipped with the same misalignment of the carrier oscillator, BFO, and mode offsets. I can't image the units are actually being tested if this problem is present.

If your unit is suffering from muffled audio on one sideband, or other frequency and offset ills you can probably use the alignment procedure posted earlier by MarkKI0PF.

I uploaded the procedure to the Yahoo group files directories in a file called "X1M IF and BFO adjustment.pdf". I'll also paste it below.

Steve WD8DAS

sbjohnston@aol.com
http://www.wd8das.net/

Radio is your best entertainment value.

X1MTransceiver IF, BFO, and mode frequency adjustments

1) Setthe IF OFFSET first, or you'll chase yer tails. With the radio hooked to anantenna receiving noise but no signal, fiddle with the IF OFFSET setting untilyou can switch back and forth between USB and LSB and the "wooshing";or "timbre" sounds about the same. All the radios are bound to bedifferent, but I set mine -300 from the value in the manual. Save the setting.

2) NOWadjust USB by moving USB BFO until a voice signal received from a localaccurate receiver is correct. Save the setting.

3) AdjustLSB by moving LSB BFO until a voice signal received from a local accuratereceiver is correct. Save the setting.

4) AdjustCW only AFTER you do the IF, USB, and LSB. I adjusted CW by setting the X1M toCW, and while receiving CW from my PRC-1099 (which xmits an 800 Hz tone onUSB), moving the CW BFO setting until the audio from the X1M zero-beat with the800 Hz sidetone coming from the 1099. Save the setting. You may want to do it adifferent way.

5) Writedown your settings for IF OFFSET, USB BFO, LSB BFO, and CW BFO. :)

Key: Setthe IF OFFSET first or you'll go in circles.

--MarkKI0PF

1003. Audio Quality on SSB

My biggest gripe is the lack of any AGC. If this were fixed, this radio would be great for portable use. With headphones, this is only marginally better but weaker signals are still quite light in volume. As of now, I'm debating on keeping mine due to this. It's a shame that I sent my first one back to Ed thinking there was a problem, and when I received the second one I only realized then that it was a flaw in the design.

Do we have any contact with the actual manufacturer besides through Ed? Is there any of this that can be handled in a firmware update?

Bill, NE4RD

Patrick,
Let's be fair here. Do Icom, Kenwood, or Yaesu sell an HF rig this size? No. Do they sell an HF SSB/CW rig for anywhere close to this price? No. We must compare apples to oranges here. Having said that, the SSB on the X1M with headphones or external speaker sounds very good once the rig is properly aligned (no tools and not much time required.) The built-in speaker faces straight up and is very directional. If you sit in front of the radio and turn the volume up because the speaker is not pointed at you, you can get some rattling and/or distortion. The radio is SMALL. Transmitted SSB is also good, but comparing one to another can be tough. Also keep in mind the radio comes with an HT speaker-mic. It works fine, but it's not a Kenwood MC-60. For SSB and digital modes, the radio is very good for its size and price. As ever, YMMV.

Topic: 1006 Message: 1006

I saw an article in Hints and Kinks some time ago where a PVC 45 or 90 degree elbow was used to improve sound from an up firing speaker. It was recommended to use an elbow the same size as the speaker.Place an elbow with one opening over the speaker and have the other one face the listener. I have used this on other radios and it worked for me. Campers can use the elbow to wind antenna wire on for storage and transport. Steve KB1CHU

Patrick,

I totally agree with Ken but I also am impressed with how good it does sound. I used mine for hours yesterday worked some DX and had a local ragchew with a friend in the area. I found it perfectly suitable for use over a couple hours. However it might even be better with am external set of cheap amplified speakers. I guess I could complain about the lack of AGC but it doesn't bother me too badly at this point. I will say that I think it compares pretty favorably to what I remember from my FT857D but I always thought that radio had the worse audio ever (so I sold it).

Good Luck & 73,

Keith

1011. Looking for HF Bird Slug

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-22 19:12:08 UTC
From: Charlie , W5COV
Topic: 1011 Message: 1011

I am looking for a low power HF element for a Bird 43 Wattmeter.

Since about 90 percent of my operation is QRP , I would like to have a more accurate way to measure power .

Please contact me off list .

Thanks , Charlie , W5COV

1012. RE: [X1M_QRP-Transceiver] directional speaker sound

From: Fred VE3FAL
Topic: 1006 Message: 1012

We used paper cups and PVC pipe for years to direct sound and for different pitch levels as well..

Works quite well..

Fred

Subject: [X1M_QRP-Transceiver] directional speaker sound

I saw an article in Hints and Kinks some time ago where a PVC 45 or 90 degree elbow was used to improve sound from an up firing speaker. It was recommended to use an elbow the same size as the speaker.Place an elbow with one opening over the speaker and have the other one face the listener. I have used this on other radios and it worked for me. Campers can use the elbow to wind antenna wire on for storage and transport. Steve KB1CHU

Here is the perfect opportunity to get Hawaii on as many modes and bands possible running your QRP X1M .

It runs from 04:00 UTC August 24 through 04:00 UTC August 26 .

Here is the URL for the home page that will give you all of the information .

http://www.hawaiiqsoparty.org/

GOOD DX !!

This was recently discussed on this forum. Pin 5 is normally the AGC input.
Because the rig does not have AGC the pot is used to set a DC level to the MC-1350, thus manually controlling the gain.

You are welcome Ray. By varying the DC voltage on pin 5 from 5 to 7VDC, the gain can be reduced by 60dB. So, all we need is an op amp or FET, a diode and a couple of resistors and caps, and the rig can have audio derived AGC.
Someone might measure the present voltage on pin 5 to see where the factory has the gain set.

Heath ,

Good to hear that you have direct contact with the manufacturer .Translating what Chinese documents we have received have made for difficult communications as far as I am aware of from people here in North America .

Did you just address those issues raised in this thread yesterday or did you perhaps also make mention of their testing settings for LSB needing to be adjusted also ?

I hope they do address the issues that were raised. It would be nice if they had someone that is fluent in English that would monitor or participate in this group.

They could get some excellent technical feedback here .

They have a really good product , just needs some what I would like to think , are minor issues to a manufacturer ,addressed . It certainly has the potential to blow everyone else out of the water .

That's great news! Well, I spent the evening slowly tuning the BFO's. I found the best setup for me was to put a T in my coax and run my FT-450D and the X1M side by side on the same signal. USB/LSB/CW is aligned and I'm zero beating at 700. Need to do an audio check on the XMIT, but maybe I'll do that tomorrow. So, all is well.

IF : 09000020
LSB: 08998910
USB: 09001125
CW : 08998625

Audio is still weak, but maybe now we'll get an answer from the manufacturer. I picked up a kit for CW filtering, so I'll have that built next week after I finish up my honey do's this weekend. Looked at some simple AGC circuits that I could probably slide into my project box for the CW filter, so we'll see on that. I may take my X1M up hiking in the Beartooth mountains this Saturday as a trial run, but not sure I want to lug the equipment for a 14 mile hike.

I think there are slight variations in all the radios. I think this is common, which why most manufacturers do the alignment before they put the radio in a box. I wouldn't worry about having yours match someone else's. I haven't seen two settings the same yet. As long as your TX and RX are on frequency, you are set. It is probably good for the group to see all the variations, so hopefully more people will post their settings.

Just a point on good engineering practice-one should never combine two transceivers into a T. It is just way too easy to accidentally TX on one rig and possibly damage the other one . Another issue is noise radiated from one's rig synthesizer etc can now be injected into the other receiver- possibly making it sound deaf or less sensitive.

Subject: [X1M_QRP-Transceiver] Re: X1M-Pro questions. Keep it or send it back?

That's great news! Well, I spent the evening slowly tuning the BFO's. I found the best setup for me was to put a T in my coax and run my FT-450D and the X1M side by side on the same signal. USB/LSB/CW is aligned and I'm zero beating at 700. Need to do an audio check on the XMIT, but maybe I'll do that tomorrow. So, all is well.

IF : 09000020
LSB: 08998910
USB: 09001125
CW : 08998625

Audio is still weak, but maybe now we'll get an answer from the manufacturer. I picked up a kit for CW filtering, so I'll have that built next week after I finish up my honey do's this weekend. Looked at some simple AGC circuits that I could probably slide into my project box for the CW filter, so we'll see on that. I may take my X1M up hiking in the Beartooth mountains this Saturday as a trial run, but not sure I want to lug the equipment for a 14 mile hike.

I don't own one of these rigs- but each rig is going to have crystals that are a bit different from one another- thus the different settings. Mindful of the SGC SG-2020 transceiver where each one was custom tuned.

Mine is

IF : 08999850

LSB: 08998850

USB: 09000950
CW : 08999850

Is every radio different or is mine that far off? Should I set mine to your settings? If there are common setting for all radios could it be put in to that wonderful users guide? Thank you for all you work.

Interesting Charlie. Gain reduction does not begin to occur until 5VDC. So she's running "wide open" and probably needs to be given the comments of low audio.

I suspect they run the front end at low gain to reduce overload and IMD problems then try to make up for it in the audio section. Perhaps not the best gain distribution. This would explain the published sensitivity of 0.4uV- relatively deaf by today's ham gear standards. Maybe the attenuator is "not enabled in this model" because it is always on and can't be turned off to prevent the overloading,etc that could occur with no AGC. Just a guess.

Thanks for the kind comments about the user's guide! The Version II manual told us where the bodies were hid - function likely supported in the firmware, and the "Chinese English" PRO (III) manual gave us an idea as to what the differences were, and where to find them. The group has been exceptionally helpful in working out the quirks and details.

However, I agree that we are seeing production variations in the filters. Thus, we need to do an alignment. Not a big deal. I have a house full of company this week, so unfortunately can't spend some serious time until next week.

FWIIW, I am going to try using the AM signal from WWV or CHU for testing. First, to get IF offset same... should be able to set for more or less equal signals in USB and LSB. Then, as WWV and CHU send a known tone (440 Hz on WWV, not sure about CHU), set USB/LSB VFOs so that I get the desired signal on Spectran or Argo (poor man's audio frequency meter!). CW -- set CW BFO so I get the same tone as the side tone that I have selected.

What do you think??

I've had confirmation from the manufacturer that they are going to look into the firmware/LSB, and the AGC.

I've suggested that they do a firmware update to address the SSB/IF default settings etc, and passed on what everyone is experiencing.

I've also made some suggestions re the AGC and making use of pin 5 on the MC-1350.

I forgot to mention the attenuator function, so I'll follow up on that.

They haven't indicated a timeframe or implementation plans, but time will tell.

That's great Heath. Charlie has pointed out that the MC1350 is running at maximum gain (at least judging from the AGC voltage on pin 5). So, if the manufacturer implements AGC they are going to have to add additional gain somewhere to make up for the loss of gain brought about by AGC action.

Finally, has anyone investigated in what stage the audio clipping/ breakup is coming from at high AF gain settings?

Paul,
Yes, many thanks to all involved in the User's Guides. All versions of it have helped me a great deal.
WWV, CHU, and other AM stations work very well for i.f. offset and SSB alignments, I also use a digital communications program waterfall (fldigi is my choice, but any of them will work) to see what's going on. To adjust the LSB and USB BFOs you can also detune, say, an AM broadcast station to get a good strong carrier signal at 1kHz or whatever instead of tuning for best audio sound. (I have a local station on 1010kHz, so I set the X1M to 1009 and adjust the USB BFO for a solid 1000Hz signal on the waterfall, then retune the X1M to 1011kHz to adjust the LSB BFO. Of course you could use WWV, CHU, or some other known-accurate station instead.) I'm still fighting with CW. I am so far unable to get the X1M to transmit on the indicated dial frequency (in a ham band) and then, without making any changes, also receive (with the proper tone frequency) a signal from another radio on that same frequency. It might be me; I think it's a firmware issue. Fred, VE3FAL has duplicated the problem and I have not yet heard from him that he has the solution. We'll see.
Have a great weekend with the family!

I would think that the clipping was because of the little LM386 used for the speaker driver.

Would be interesting to put a scope on the input to the 386 to confirm.

> WWV, CHU, and other AM stations work very well for i.f. offset and SSB alignments, I also use a digital communications program waterfall (fldigi is my choice, but any of them will work) to see what's going on. To adjust the LSB and USB BFOs you can also detune, say, an AM broadcast station to get a good strong carrier signal at 1kHz or whatever instead of tuning for best audio sound. (I have a local station on 1010kHz, so I set the X1M to 1009 and adjust the USB BFO for a solid 1000Hz signal on the waterfall, then retune the X1M to 1011kHz to adjust the LSB BFO. Of course you could use WWV, CHU, or some other known-accurate station instead.) I'm still fighting with CW. I am so far unable to get the X1M to transmit on the indicated dial frequency (in a ham band) and then, without making any changes, also receive (with the proper tone frequency) a signal from another radio on that same frequency. It might be me; I think it's a firmware issue.

I haven't tried to duplicate that problem yet, but clearly a firmware issue, IMHO.

Fred, VE3FAL has duplicated the problem and I have not yet heard from him that he has the solution. We'll see.

Hey, I like that trick of setting USB/LSB BFO. Just did it with CHU, and changed dial frequency. Very slick!

/paul

OK, you might very well have the issue resolved. I am not clear by what you mean by CW-USB mode? Insertion on high side of received carrier? Please elaborate.

Default tone is 800. Do you mean it should be set to 700?

Do I adjust CW BFO, and if so, to achieve what?

Thats great Heath! Any word on whether they are just looking to update the PRO line or are they talking the v II line some of us have as well? And if they are -- do you know if that might include a firmware update to include the full 40m and 80m bands filtered?

Thanks!
-Chris

ps - Sorry I think I sent you a private message like this before and I meant to post it to the group. The new format fooled me.

I will try to get a good look at the audio chain this weekend (in between Hawaii contacts lol) . I 'll "try" to follow the receive chain as much as is possible by sight and the version 1 schematic in the files . I'll try to get some voltage readings and see how hard they are pushing the LM-386. Luckily the 1350 and 386 are right on top of the top board and are not surface mount , so there is a good possibility to get a good idea of the audio end of the receive chain . We old fellers sometimes have issues seeing those tiny new fangled parts .<grin>

I have a full bench here, Tektronix spectrum analyzer ,HP SLM , HP frequency counter , GPS locked ,precision synthesizers , good dual trace scope , just need a day when this old body of mine that has been badly abused , through no real fault of mine , will allow me to spend an entire day putting this through all the test gear . So I do have the bench ability to check the specs on the radio , just waiting on my body to give me that good day :)

If you are thinking of getting the free version of Ham Radio Deluxe the author is removing all version 5 software from the downloads/archive area of his server on September 1, 2013. You have to pay for version 6. The latest version is 5.24.36

Paul,

Yes, many thanks to all involved in the User's Guides. All versions of it have helped me a great deal.

WWV, CHU, and other AM stations work very well for i.f. offset and SSB alignments, I also use a digital communications program waterfall (fldigi is my choice, but any of them will work) to see what's going on. To adjust the LSB and USB BFOs you can also detune, say, an AM broadcast station to get a good strong carrier signal at 1kHz or whatever instead of tuning for best audio sound. (I have a local station on 1010kHz, so I set the X1M to 1009 and adjust the USB BFO for a solid 1000Hz signal on the waterfall, then retune the X1M to 1011kHz to adjust the LSB BFO. Of course you could use WWV, CHU, or some other known-accurate station instead.) I'm still fighting with CW. I am so far unable to get the X1M to transmit on the indicated dial frequency (in a ham band) and then, without making any changes, also receive (with the proper tone frequency) a signal from another radio on that same frequency. It might be me; I think it's a firmware issue. Fred, VE3FAL has duplicated the problem and I have not yet heard from him that he has the solution. We'll see.

Thanks for the kind comments about the user's guide! The Version II manual told us where the bodies were hid - function likely supported in the firmware, and the "Chinese English" PRO (III) manual gave us an idea as to what the differences were, and where to find them. The group has been exceptionally helpful in working out the quirks and details.

However, I agree that we are seeing production variations in the filters. Thus, we need to do an alignment. Not a big deal. I have a house full of company this week, so unfortunately can't spend some serious time until next week.

FWIIW, I am going to try using the AM signal from WWV or CHU for testing. First, to get IF offset same... should be able to set for more or less equal signals in USB and LSB. Then, as WWV and CHU send a known tone (440 Hz on WWV, not sure about CHU), set USB/LSB VFOs so that I get the desired signal on Spectran or Argo (poor man's audio frequency meter!). CW -- set CW BFO so I get the same tone as the side tone that I have selected.

What do you think??

Wonder where everyone is located , so maybe we can have more X1M to X1M contacts . The bands here all of them were terrible in the early morning hours . Likely the result of all of the solar activity this week.

I am located in Northeast Oklahoma . I am only 1/2 mile south of the Kansas / Oklahoma state line . I can literally see structures over in Kansas from my backyard .

I live in what is often called the 4 state area also since Kansas , Oklahoma , Arkansas , and Missouri come very close to all joining into a true 4 state corner . I am only about 60 miles west of Joplin , Missouri .

lol Dale , I guess it does pay to look people up from time to time . I should have recognized you from more than one group and project . My old brain doesn't function so well these days :)

Absolutely beautiful work on the Hallicrafters .

I have an SR-150 and T O Keyer that I have gone through electrically , and now it is on to the cosmetics .

Just checked into the local state net on 3.900 MHz. Will probably not get on too much until later this evening 0:300 until all of the bands close down . Nice thing about being an old bachelor with just 2 dogs to have to keep happy . Time has little relevance to me so I am just as apt to be on at 2 or 3 a.m. as I am 2 or 3 p.m.

I spend a lot of time monitoring 7.208.5 , in case a friend of mine in Alabama shows up . He lives in a remote area of the state where much of my family is located .

Then some receiver is always on one of the experimental bands . Usually use the SLM for that .

My bad, just confirmed it's transmitting up the the tone value. So, if you are set at 14.042.0 (700), your tansmission is going out zero beating to 14.042.7

That's what I get for testing stuff late at night. So, we need a patch or something to make this thing useful for CW.

(I have a local station on 1010kHz, so I set the X1M to 1009 and adjust the USB BFO for a solid 1000Hz signal on the waterfall, then retune the X1M to 1011kHz to adjust the LSB BFO. Of course you could use WWV, CHU, or some other known-accurate station instead.) I'm still fighting with CW. I am so far unable to get the X1M to transmit on the indicated dial frequency (in a ham band) and then, without making any changes, also receive (with the proper tone frequency) a signal from another radio on that same frequency. It might be me; I think it's a firmware issue. Fred, VE3FAL has duplicated the problem and I have not yet heard from him that he has the solution. We'll see.
Have a great weekend with the family!

On Aug 23, 2013, at 10:50 AM, W3FIS wrote:

Thanks for the kind comments about the user's guide! The Version II manual told us where the bodies were hid - function likely supported in the firmware, and the "Chinese English" PRO (III) manual gave us an idea as to what the differences were, and where to find them. The group has been exceptionally helpful in working out the quirks and details.

However, I agree that we are seeing production variations in the filters. Thus, we need to do an alignment. Not a big deal. I have a house full of company this week, so unfortunately can't spend some serious time until next week.

FWIIW, I am going to try using the AM signal from WWV or CHU for testing. First, to get IF offset same... should be able to set for more or less equal signals in USB and LSB. Then, as WWV and CHU send a known tone (440 Hz on WWV, not sure about CHU), set USB/LSB VFOs so that I get the desired signal on Spectran or Argo (poor man's audio frequency meter!). CW -- set CW BFO so I get the same tone as the side tone that I have selected.

What do you think??

Great Charlie. I'll put the K3 on the 40M freq tonight. I check in with a tech group on 7128 evenings and mornings- mostly an SWL here.
I have 2 wonderful rescue pups- a Silkie Terrier and a deer faced Chihuahua- great company in the lab.
My main hobby is 23cM EME and I am just getting access to the moon tonight as it gets into positive declination. S that will take some of my time also. Neat on the SR-150- a beautiful radio.

lol Dale , I guess it does pay to look people up from time to time . I should have recognized you from more than one group and project . My old brain doesn't function so well these days :)

Absolutely beautiful work on the Hallicrafters .

I have an SR-150 and T O Keyer that I have gone through electrically , and now it is on to the cosmetics .

Just checked into the local state net on 3.900 MHz. Will probably not get on too much until later this evening 0:300 until all of the bands close down . Nice thing about being an old bachelor with just 2 dogs to have to keep happy . Time has little relevance to me so I am just as apt to be on at 2 or 3 a.m. as I am 2 or 3 p.m.

I spend a lot of time monitoring 7.208.5 , in case a friend of mine in Alabama shows up . He lives in a remote area of the state where much of my family is located .

Then some receiver is always on one of the experimental bands . Usually use the SLM for that .

Wonder where everyone is located , so maybe we can have more X1M to X1M contacts . The bands here all of them were terrible in the early morning hours . Likely the result of all of the solar activity this week.

I am located in Northeast Oklahoma . I am only 1/2 mile south of the Kansas / Oklahoma state line . I can literally see structures over in Kansas from my backyard .

I live in what is often called the 4 state area also since Kansas , Oklahoma , Arkansas , and Missouri come very close to all joining into a true 4 state corner . I am only about 60 miles west of Joplin , Missouri .

1049. X1M Platinum and CW, anyone made a qso yet?

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-24 00:32:46 UTC
From: Fred VE3FAL
Topic: 1049 Message: 1049

Just curious as to if anyone has made a qso yet with the X1M Platinum ?

I made all the IF offset adjustments and cw adjustment but still issues as far as I can see with the radio, the transmit and receive are still off, I can mark my transmit on the other rig, but have to move vfo to hear station on qrg.

It also functions like my old Oak Hills research OHR-40 cw receiver in that I hear the signal twice and have to tune down to get the station spot on.

I know you guys are making SSB qso's. but who has used it on cw so far with success?

I know I made all kinds on the X1M Ver II.

Fred

Hi Fred,
While I don't own the XM-1, if you are hearing boths sides of a CW signal, then the IF is not properly placed in the xtal filter.
Not owning the rig, I cannot tell you how to do this, just an observation.
GL,

From: W3FIS
Topic: 1054 Message: 1054

OK, we have a good (various) handle on ways to set up the IF shift and LSB/USB. Using an AM station (carrier + USB + LSB) and shifting 1 kHz would seem to be "best practice" at this point, IMHO.

The jury seems to be out on whether we have, or do not have a problem with CW -- xmit and receive frequencies apparently different, when they should not be.

Can we solve this? If so, how, or do we have a "feature" that needs to be fixed in firmware.

The audio issue seems to lie with the LM386 chip. Getting an amplified computer speaker would appear to be the most straight forward solution, short of a better audio chip.

AGC - we don't have any. Can't win them all....

Inquiring minds want to know...

Thanks!

1060. HAWAII CONTEST

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-24 09:38:47 UTC
From: Charlie , W5COV
Topic: 1060 Message: 1060

Well the bands are poor and lots of QRN here . Haven't heard many stations out of Hawaii , but it only takes one per band per mode right ??? lol

I managed 1 so far on 40 meter SSB (NH6WZ) at about 4 a.m. Central Daylight Time . Now if I can find either a CW one here on 40 or both modes on 80/75 before daylight I'll be one VERY happy camper !!

That means I am probably not going to be on the group very early today . But when I am will start stalking on 20-15-10 .
MAYBE I'll get lucky and get both a new country and a new state .

I have WAS several times over the years and have worked unknown well into the 100's DX stations over the years . I suffered a few year slump in being very active on the air , waiting for the peak of what will probably be my last Sunspot Cycle that I will feel like working . Then that has turned into a real disappointment , so I needed something to stir up my interest in ham radio again .

End of spring or beginning of summer I decided to reset ALL of the logbooks to zero from 160 through 432 MHz. (VHF/UHF weak signal SSB/CW too).

So I want to work all of you guys and your X1M's since nearly every contact that I make is a new something , Grid , County , State , Band , Mode , anything they have a piece of paper for . The X1M became available quite by coincidence , with my learning of it shortly after I had made the decision to reset the logs . So I will try them all first with the X1M and I am a very patient operator to try and get right in the other stations mode of operating and hopefully grab his attention in that brief instant . Now since it is such a challenge especially with the WARC bands and no 6 meters or above on the X1M , I will also use up to 100 watts input from my high power rig if I need to :)

If you can hear em you can work em if they are any kind of operator at all . Heck they don't know you are QRP so I act like I am a "big gun" and call CQ with authority in my voice . lol

BEST DX !!

Topic: 1003 Message: 1065

Thanks for posting the frequency Merrill . It is good to know nets that have a time for QRP check ins . Most nets will pick up mobiles and QRP stations but with many of them it is an afterthought especially with QRP .

Twenty sounds hot here right now so going to try and knock off a couple of more Hawaii stations in different modes . I have a note somewhere too about an I think maybe Burlington Northern "Caboose" special events station today also.

Since the tuning procedure is pretty well simplified so everyone can tweak their radio , we are going to have to start up an X1M net , then we know the net control will listen for QRP stations :) Maybe just a special time and frequency and we can have a nice roundtable and listen to each others rigs and swap hints and ideas .

I am in a good central location , but I lack a decent antenna system at the present . Almost every contact here is a miracle :) I have a G5RV that isn't quite 30 feet to the center , so I still have some open wire laying on the ground . Don't have any neighborhood kids or anything to get one to toss me a rope or use a slingshot up over one of the trees to get the center up to about 50 or 60 feet . I also have a 5BTV ground mounted . My throwing arm won't make it probably as high as it already is .

I have a 60 foot Rohn tower that folds over at the base , but I have to wait until my sons have enough vacation time to come down and work on it . It has a 2 meter and 432 beam on top but the rotor quit and it is the original support that I had too small of a rope on for too long to pull my dipoles up and down to the 50 foot level that broke.

If I happen to get them to get that done before fall I will be VERY happy !! My dipoles will be up where I want them , a new rotor will get installed , along with an Ameritron remote coax switch , both of which have been laying here for a couple of years . Then I can put up a 222 MHz. antenna to go with the 2 and 432 horizontal antennas for weak signal VHF/UHF work. I have a roll of 1/2 inch heliax to run up the tower to the remote switch .

Running the G5RV on 6 meters right now too . They can say what they want about that antenna , but if it weren't for it , I wouldn't be on the air at all and I make lots of contacts even in it present configuration . Since the season is about on top of us , I like to work 160 and once again I use the G5RV (it is the 102 foot model). I tie the ladder line together and use it as a symmetrical tee . The first night that I tried that , when the antenna was at 50 foot to the center point and the ladder line all vertical , some contest was on that night and I worked 23 states QRP !!!! Thought maybe I was going to get WAS on 160 all in

one night .<grin> So the G5RV is a real workhorse here for me as the antenna of choice right now for 160-6 meters .

Look forward to working some of you this weekend on probably 20 or 40 depending on where you are . Haven't put my "filter box" together yet so I can run on 17 meters . When I started my log count all over again was the first time I had ever spent any real time on 17 meters . My two favorite bands now are 17 and 30 meters !!

I have to go out for dinner tonight, but will listen Sunday night Merrill. An XM-1 net is a great idea- then all you guys can hear what the XM-1 sounds like.

It would be great if the XM-1's extruded cabinet could be made available. Then, for fixed station use, fetaures such as 160M filters, extra audio etc could be available. Perhaps even total audio derived/controlled AGC w/o having to dig into the rig.

Fun Stuff,

Dale W4OP

Just thought I would let the group know that Charlie, W5COV and I hooked up immediately on 20M. I cheated a bit and was running 30-400W from My K3 and SPE Expert 1K-FA amp and Yagi pointed his way. Very nice sounding signal from his XM-1. I measured his occupied BW as being from 80HZ-->2.6KHz. It may be worthwhile to position the carrier a bit higher in the passband - but no complaints here on his SSB as is.

The microphone connection is prone to stress so I would look at the solder joints and make sure a wire hasn't come off . Paul recommended filling the plug with I believe it was RTV to help relieve the stress. Also some people report the same issue unless the microphone connector is really pushed in hard .

It was a real surprise to hear Dale pop up out of the noise here . He did fade just to where I could barely copy him at times , but I never completely lost him with the phones on . I think we had kind of a "magic moment" the X1M Gods were smiling on us today .The band is very erratic with a lot of noise . When the band was up he was quite strong and no signs of overload using the phones and computer headset wired with an external PTT switch in a bottle :)

From: kb3nuf
Topic: 1091 Message: 1091

Doing research and thinking about purchasing one of these neat QRP rigs.

Can you generate a steady CW tone on the X1M to use with a manual antenna tuner without having a key/paddle?

If yes, what is the procedure?

Getting ready to pull the trigger on the purchase and want to also order any other items I need for battery powered QRP OPS.

73 KB3NUF

1092. X1M L-C filters

Yahoo group: X1M_QRP-Transceiver (2013)

No you can't directly do it from the microphone or front panel that I am aware of. However you could rig something up like I did for my PTT with my computer headset .

I put a momentary normally open push button switch in the end of a small plastic film holder , but like Paul suggested you could also use a small pill bottle . Drill a hole in the bottom to run the cable out and drill a hole in the top for the switch . My cable is long enough that I can hold it in my hand and still type on the computer for logging . I also tied a knot inside of the bottle to keep from getting the cable caught and pulling the wires off of the switch .

Set the keyer setting on the radio to "M" (manual) . Then run your two wires to your key plug that comes with the radio . When you are ready to tune up go to the CW mode , press the switch down and you will have a carrier to tune your manual tuner with as long as it is pressed down.

Just one thought of how to do it .

Topic: 1091 Message: 1094

Short answer: Yes, sort of.
There is no provision for a "tune" signal. You must switch to cw mode and "key" the rig. If you do not do cw and just want the auto-tuner to do its thing, make sure the X1M keyer function is set to manual (it will read "KYR:M" on the line below the VFO B frequency) and use any sort of momentary-on switch you prefer to send a signal. Do NOT just put a shorting plug in the key jack. Having the rig transmit continuously whenever it is in the cw mode is bad manners and could burn things out.
I received my X1M last Monday and have not yet had it to the field. Be advised that the tech specs say it draws about 500mA on receive, so you will need a decent battery if you plan to operate for long periods. Should be great for QRP SSB.
Have fun with whatever rig you decide on.

Another good question to answer is just WHEN is it switched in???

Would that be a "default" filter to keep higher frequency stuff from radiating?? Maybe cuts off all stuff above 30 MHz? Just my guess. Otherwise, why would it even be there?

Given that the rig receives 100 kHz to 30 MHz, and the five ham bands use band-pass filters in the receiver, I would guess #6 is a LP filter with 30 MHz cut off, switched in whenever you tune outside the five designated ham band ranges. But I could well be wrong.

Maybe we could test it, since there is not AGC. When we get close to 30 MHz, we should see the noise drop as the filter starts to cut in, unless it is has a VERY sharp filter cutoff. However, I just tried it, and crept up on 30 MHz, but no difference by my ear. A mystery...

Hi Ken,
The more I thought about it, I think you are correct- for general coverage, filter 6 is probably switched in. Does anyone have the values of the three shunt caps in filter 6? I can plug it into Genesys and get a plot.

Topic: 1105 Message: 1105

Hi Everyone,
Just got my rig the other day and set it up Saturday am. I was listening on 14.305 Sunday and didn't hear anyone just a tone. So I tuned up to 14.310 and later on 15m, and the Hawaiian Is QSO party was still in full swing. Heard lots of folks calling in from CO AK TN KY. Easily 57 to 59 on most. Couldn't hear anyone that called from my own state-CA undoubtedly a propagation issue. Unfortunately no one responded when I tried to answer the CQs. Not enough power to break into the pileup I guess. However, back to my beginning thought, I think the idea of setting up an X1M net would be a great idea. That way everyone could expect a time and freq to try to make contact with other users to shake out the tx and rx bugs and settings.

Thanks to all that have shared their knowledge so far on these interesting little rigs.

I went through all bands, and the tone is offset on every filtered band (80-40-20-15-10). I didn't not test the other bands, but I would assume the offset is broken throughout. Do we have any update on this issue? Or should we start shipping these things back?

Bill, NE4RD

> WWV, CHU, and other AM stations work very well for i.f. offset and SSB alignments, I also use a digital communications program waterfall (fldigi is my choice, but any of them will work) to see what's going on. To adjust the LSB and USB BFOs you can also detune, say, an AM broadcast station to get a good strong carrier signal at 1kHz or whatever instead of tuning for best audio sound. (I have a local station on 1010kHz, so I set the X1M to 1009 and adjust the USB BFO for a solid 1000Hz signal on the waterfall, then retune the X1M to 1011kHz to adjust the LSB BFO. Of course you could use WWV, CHU, or some other known-accurate station instead.) I'm still fighting with CW. I am so far unable to get the X1M to transmit on the indicated dial frequency (in a ham band) and then, without making any changes, also receive (with the proper tone frequency) a signal from another radio on that same frequency. It might be me; I think it's a firmware issue. Fred, VE3FAL

The radio transmits on the dial frequency. The side tone value and CW BFO setting must be the SAME. You need to tune the incoming signal to MATCH the chosen side tone frequency. Do NOT zero beat the signal, or you will be off by (surprise!) the value of the side tone.

I find a spectrum analysis program like this to be very useful.

http://www.qsl.net/zl1an/Software/Spectrum3.zip

See procedure in the User's Guide.

I understand that it transmits on the dial frequency, that seems to be the main issue. When compared to the two other rigs I have on the bench, the RX signal and frequency match. So, you're saying that you can be off frequency enough in the dial to perceive that you're zero-beating a signal in the RX and your TX follows suit? I'll play with it tonight and see if I can get things "aligned" for CW, if you can call it that.

When you tune (after CW alignment), TUNE FOR THE TONE EQUAL TO THE SIDE TONE THAT YOU HAVE SET UP. Very useful, if you have a "tin ear" like mine to use some sort of spectrum analysis, so that tone of desired station falls on the side tone that you have selected and aligned for.

Paul,
I do't know to whom your comment was directed. I just (again) confirmed my findings.
I set two radios (my X1M Pro and my K3) to the same freq - this time 28.027 - in cw mode, with the same cw pitch (600 Hz) selected for a beat note. Then I adjusted the cw BFO on the X1M to put its signal on 28.027, the dial frequency. The K3 responds with a nice signal and the proper beat note (600Hz) I can easily hear. Without changing anything, when I then key the K3, the X1M does not give me a nice audible beat note. The 28.027 MHz signal from the K3 yields an inaudible zero Hertz "beat note" in the X1M. This, obviously, does not make for good copy.
Can you identify a flaw in my logic or technique?
Sincerely,
Ken, W1KRT

You set the CW BFO such that with a carrier -- use WWV, CHU, or an AM broadcast station the tone is exactly the SAME as the side tone pitch you have selected.

When you then tune the X1M, you tune for the CW signal to have the SAME pitch as the side tone frequency that you have selected.

I was just working on figure this out last week. According to the schematics for ver II that is seems to be exactly what happens on the LP Filter. There are 5 LP filters. The 5th one is switched in for 10m s and another of the other 'not extra filtered' bands. That is why the relays don't click on 10ms -- is the LP filter that is inline by default so no extra relay to flip in.

As for the cap values they are in the schematics and in fact I have spice files for the filters that someone created for me off the schametics and the associated plots. I can upload those to the group if people are interested in having those.

Also of interesting note -- my buddy who is helping wiht this all noted that the schematics appear to indicate that the relay states go directly to the pins on the DB9. So THEORETICALLY -- it might be possible to engage or unegage/switch the filters outside of the microprocessort logic. He thinks they are there for an antenna selector switch to read hte values but not change them. But the idea of being able to look at ht filters and determine the 15 m would remove the 9 MHz spur and be good enough just by using a dongle on the DB9 an a selector switch might be a pretty awesome way of getting 12/17 m LP filtering in line.

Also looking at the schematics it looks like there are 6 bandpass filters. 1 for each of hte support band and then a general one that is the default. I don't think it is switched in line persay with relays but there is some sort of diode selector I'm working on understanding. The schematics of that section are less than stellar. So even if we could trick the x1m to engaging suitable LP filters for TX, RX would still likely suffer.

Given that the rig receives 100 kHz to 30 MHz, and the five ham bands use band-pass filters in the receiver, I would guess #6 is a LP filter with 30 MHz cut off, switched in whenever you tune outside the five designated ham band ranges. But I could well be wrong.

Another good question to answer is just WHEN is it switched in???

Would that be a "default" filter to keep higher frequency stuff from radiating?? Maybe cuts off all stuff above 30 MHz? Just my guess. Otherwise, why would it even be there?

Awesome Paul!

I'm waiting for this knob to arrive to replace the tunning knob with something a bit more comfortable. It appears to be the same style and when I measured my ver II I think I had about a 0.5" radius from the center of the rotary encoder. So the 0.995 inches will hopefully fit nice and snug in there and give my fingers some breathing room.

http://www.amazon.com/gp/product/B00AO3RI6W/ref=oh_details_o01_s00_i00?ie=UTF8&psc=1

That also allows me to 'reuse' my tunning knob onto the red power knob. BONUS!

Did you ever get any more insight into this Mark? I have one of the original models too and I'm working on benchmarking it myself so I'm particularly curious about other folks benchmarking processes are. So far I've plugged in an inexpensive chinese freq counter/watt meter and with a full cw signal it reads the 5w. On USB it basically read nothing using my voice. I emailed Ed and he explained the mic gain control on the inside of the radio which I increased it by 1/4 turn and tried again. Ed also sent me a phone number to a constant tone he used to test the output. Using that tone, with the mic gain up, using Ed's tone -- I could get it to register 2 ws ish I think.

I picked up an analog SWR meter this weekend at a local hamfest and now on 10 m USB using Ed's tone I can get 5-6w. Talking into the mic I'm still only getting 0.5 or so max. So more benchmarkin and playing to see if it should go back or if it is a matter of tweaking everything.

Anyway -- I'm curious if you ever figured more out and/or how you are testing it? I'm learning on the fly so while I am having a ball I certainly don't ACTUALLY know what I am doing persay.

Chris,
In order to get somewhere close to a true Po on SSB you will need to have a wattmeter that measures PEP. You can modify an existing meter by simply adding an integrator.

Thanks Dale! I'm working on getting a time to go to another hams lab and get this thing on some serious test equipment. I'll have to check that out.

The SWR meter I can flip it to forward power and then using a steady loud tone I was projecting it would be a crude approximation. So when I saw 5-6 w using that method I totally chaulked it up to working! Glad to know the right way to do it! I'll look into that since I have no idea what one of those us.

Oh my problem is that the website isn't responding. When I get to the files section I click on the any of hte links and sometimes the next window opens, sometimes not. Finally I got into the schematics 'folder' and when I click on the Upload button nothing happens. The website acts like I clicked nothing.

But the links on the groups page are being non-responsive as well like just clicking on the 'Files' section sometimes response and sometimes not. It feels like either my browser settings doesn't like the new interface or more likely Yahoo's servers are slow and just not responding snappily.

I wonder if you might want to share the phone number that Ed shared with you. I am basing my observation on the past 4 months of usage. I usually see about 4 watts on voice peaks on 15 and 20 meters, 5 watts on 40 and 17 meters.using the watt meter on my AEA antenna tuner. Only about 2 watts on 10m but it has been that way since I got it. I have checked the meter against my other MFJ tuner and find the same result. I emailed Ed over the weekend and am waiting for a reply.

Yeah let me dig that up out the email that I've VERY bad at organizing....

Here is it: 704-982-2818

Ed said he checks any replacemnt radio that goes out the door (but can't swear to it) and his testing method is dialing that number up and holding it to mic. So now I see where I got the idea this was a good stand in! He also mentioned the mic connector soldering joints and adjusting the mic gain trimmer:

"It is beside the adjustment for the side tone. (grab the new manual off my site) A 1/4 turn clockwise
should boost the mic gain and show output with SSB."

I found on my vII of the radio that hte trimmers were not in the exact spot his photo showed so I guessed and turned one. I haven't gone back in to see if I turn it down does my crude measurement stay or reduce as expected. Also means I might have adjusted the side tone or something else. Opps. My wasn't directly left it was an inch up or down left. I rememer it being more of an upper case to the left sort of placement than the direct left. Or was it right. I picked the side the manual didn't show it on.

I can check when I get home if you care but there is his number and his general repsonse to me.

I haven't tested past 10m just yet due to to time using this method so I don't have anything to for you to compare it too besides that one. I'm planning on running all bands of testing then we might have something meaning to compare to each other :) Also my budget meter I grabbed over the weekend is one of the Aries CB meters so I know it is 'ok' at 10m but no idea how it callibrates out on the other bands.

Alright they are uploaded. In the zip file is the .sp files and the .pdf plots of the .sp files. The plots are hard to read as the horizontal axis are different scales and are really wide. When I replotted them I made them linear, started the scale at 3 Mhz and plotted to 45 or 50 MHz to see the curve down to -30 db on the 10m filter.

I haven't gone through the exact hoops to get it from ngspice and into a pdf to upload my changes in the plots. Not hard just hadn't taken the time to change them from .ps files to .pdf files. I can get to that sometime this week if folks are interested in seeing them. Probably tonight but I don't want to over promise myself :)

-Chris

ps - I didn't create the spice files so I assume bs1 directly corelates to the bs1 on the schematic especially since my buddy who created them does dsp work for the navy I expect professional habits to kick in. But if something doesn't match -- you might be right. And also thanks to my buddy Mark for putting this together for me as I learn how to model circuits to look into them myself. We haven't done the bandpass ones yet but I'm curious to see what those look like one paper as well.

Hi Paul et al,
I don't see how changing the CW BFO frequency can accomplish the proper RX/TX split- it moves both RX and TX frequencies and only changes the postion of the signal within the filter passband. The issue I see is that the CW Tone should change ONLY the TX frequency. This is standard amongst rigs today. But CW Tone is changing both TX and RX frequencies. I ran a number of tests using an Adret synthesized generator as a frequency source and an Agilent frequency counter- both saved to a Rubidium standard. No matter the CW Tone or the BFO offset, TX and RX frequency remained within 20Hz of one another.
I have only had the rig for 8 hours and am still learning its menues so:
YMMV,

Dale W4OP

When you tune (after CW alignment), TUNE FOR THE TONE EQUAL TO THE SIDE TONE THAT YOU HAVE SET UP. Very useful, if you have a "tin ear" like mine to use some sort of spectrum analysis, so that tone of desired station falls on the side tone that you have selected and aligned for.

Yes, but not quite as elegant! <grin> I was an Engineer in my previous life. My XYL has me in a 12 step recovery program. It does not work...

I got 10 (!!) pieces of the knob that is pretty much like the frequency change knob, so messing one up is not a big deal...

It changes neither.

and only changes the postion of the signal within the filter passband.

It does that. If you don't have the tone at the same place, you will NOT get transmission at the desired location. ONLY with the tone at a specific location. A convenient location is the side tone frequency.

The issue I see is that the CW Tone should change ONLY the TX frequency.

I am not sure about that.

This is standard amongst rigs today. But CW Tone is changing both TX and RX frequencies. I ran a number of tests using an Adret synthesized generator as a frequency source and an Agilent frequency counter- both saved to a Rubidium standard. No matter the CW Tone or the BFO offset, TX and RX frequency remained within 20Hz of one another.

As it should. Not bad.

Paul,
We are not communicating. I apologize for my unsuccessful efforts to explain my position. Doing as you suggest also changes the transmit frequency. I do not want to do that. When the TX is set to transmit on the dial frequency, the receiver BEAT FREQUENCY OSCILLATOR should be offset from the TX by the amount of the desired BEAT FREQUENCY. I should not have to change the radio tuning. I can narrow my main station rig to a cw bandwidth of 20 Hz, and when a received cw signal is centered in that passband, I hear a pleasant beat note of my choice. When I transmit, my signal is on the same RF frequency as the signal as the one I received, and which is indicated by the radio's digital readout.
The X1M does not appear to be capable of the BFO offset between receive and transmit; consequently if the TX agrees with the dial, the RX will be "zero beat" - a 0 Hz beat note, which is not passed by the audio stages and would be inaudible if it were. I'm no engineer, but I've been using short wave radio since Ike was in the White House, and based on my experience, the current behavior of the X1M is not standard.
If you are satisfied with how yours works, I'm happy for you. I just think it can be made much better.
72 (you do QRP, right?),
Ken, W1KRT

Re-reading and thinking some more, I guess what you are trying to tell me is that a properly aligned X1M does not transmit CW on the dial frequency. If I have a sked with someone at 7030 KHz and my designated "cw tone" is 600 Hz, I will hear my friend if I tune to 7030.6, and he will hear my transmitted signal on 7030.0. Is that what you are saying? This is what I have been saying all along: the rig does not transmit and receive cw on the same frequency (as indicated by the digital readout). "Round and "round we go....

I think so. In item 12, change the "0" to a "1," then press SYS button. You get NO (default), turn Frequency knob to YES (it changes the background, then press the freq. knob again to accept. You should get a beep, and it returns to main menu. Check your results. It think that should do it.

I am rapidly loosing my mind tonight... Do not go there....

Hey... more food for thought. I just went to 40 meters, put it in CW mode. I get a nice beat tone on a station. I then "zero beat" the signal. Ok, now we are on the frequency of the sending station.

I now turned on the RIT parameter. Turning the frequency knob now MOVES the receive frequency effectively. Moved until a get a nice tone (took a few turns).

Does this do the trick?? We transmit on the desired frequency (zero beat), but RECEIVE at one such as to give us a good monitoring tone?

Would somebody give this a try???

It seems to make sense to me, as I have a QRP Kits DC40B that SHIFTS the receive frequency above the transmit frequency, which is crystal controlled.

What do you think? If I am right, we have found the solution to our problem. A trifle awkward, but doable, I think.

Inquiring minds want to know...

Agreed Ken- that's what I see here.
Nothing I have tried will separate RX and TX. The only thing I could do is perhaps use RIT- but once engaged (as I see it now) you cannot continue to tune the RX with RIT on. But again, I am new to this rig- but not new to designing transcevers.

Paul,

We are not communicating. I apologize for my unsuccessful efforts to explain my position. Doing as you suggest also changes the transmit frequency. I do not want to do that. When the TX is set to transmit on the dial frequency, the receiver BEAT FREQUENCY OSCILLATOR should be offset from the TX by the amount of the desired BEAT FREQUENCY. I should not have to change the radio tuning. I can narrow my main station rig to a cw bandwidth of 20 Hz, and when a received cw signal is centered in that passband, I hear a pleasant beat note of my choice. When I transmit, my signal is on the same RF frequency as the signal as the one I received, and which is indicated by the radio's digital readout.
The X1M does not appear to be capable of the BFO offset between receive and transmit; consequently if the TX agrees with the dial, the RX will be "zero beat" - a 0 Hz beat note, which is not passed by the audio stages and would be inaudible if it were. I'm no engi neer, but I've been using short wave radio since Ike was in the White House, and based on my experience, the current behavior of the X1M is not standard.
If you are satisfied with how yours works, I'm happy for you. I just think it can be made much better.
72 (you do QRP, right?),
Ken, W1KRT

Re-reading and thinking some more, I guess what you are trying to tell me is that a properly aligned X1M does not transmit CW on the dial frequency. If I have a sked with someone at 7030 KHz and my designated "cw tone" is 600 Hz, I will hear my friend if I tune to 7030.6, and he will hear my transmitted signal on 7030.0. Is that what you are saying? This is what I have been saying all along: the rig does not transmit and receive cw on the same frequency (as indicated by the digital readout). "Round and "round we go....

That works but is quite awkward. Contesting would be very slooow if we had to use this method.

I will chime in here now also and I also spent a day extensively testing CW on both the original version and the Platinum (PRO) version . We DO INDEED have a problem with CW and it does appear that a firmware update is needed .
Thanks , to Dale , Paul , Fred , and others for their input and feeding me information so I could get them both on the bench today . Luckily I was able to do side by side comparisons . Wavetek 5100 Synthesizer , HP Frequency Counter , HP-3586C SLM , all locked to a Wenzel OCXO 10 MHz. oscillator and an Adafruit GPS 1pps . Thanks to Dale and Paul in particular for recommending the testing methods and for allowing me to participate in verifying the information that Dale initially sent me .

Paul and Dale have a bit of a duct tape method that would get us by if we HAD to make a CW contact .

This information and the SPLIT information MUST be conveyed to the factory ASAP , because I would imagine they are running flat out on the next production run and these , along with the LSB , Attenuator , firmware changes need to be made BEFORE they leave the factory .

Next question . Can we find out from the factory if there is any way for us to perform firmware updates , whether it be by the computer port or burning a new micro .

By now we SHOULD be able to get the PRO schematic , since it is in full production I am quite sure . Does anyone in this group speak or write Chinese fluently ?? There seems to be a language barrier involved also . IF we can establish RELIABLE communications with the factory , we NEED someone that can represent their product to join this group . We have a number of competent engineers on here , that also have just as good of test equipment as the lab at the factory .

We also need to generate a MASTER LIST of problems , since the problems are scattered through our findings as we run across them . Have the factory send Ed some pre shipment models ASAP and also if the factory is going to have to provide the firmware for the upgrades , have them get us some of those chips here ASAP as well for BETA testing .

I believe that they sincerely want to put out a quality product , but they certainly need to have our feedback in order to do that . We don't want to get to the point yet of generating a "wish list" but rather get a well established and well tested STABLE version . There is plenty of time and a good market later to add to the rig or even produce a different model but we need to assure that what is already here gets made into a STABLE version . They should indeed make this a TOP PRIORITY

. As much as they have riding on this rig they should take the time and go to the expense of at least getting several pieces of firmware to us THIS WEEK .

I have no financial interest in this other than my radios , but this radio CAN be a REAL WINNER and let the competition catch up with them . If the issues we have already identified are resolved quickly then there is no reason that they can't get some new firmware out this week JUST for BETA testing .

Lets get a solid list of the problems that we are aware of ASAP , tonight or by morning and get that to Ed so we can do our part to get these issues resolved ASAP . The expense of using fast high priced global mail or whatever is the quickest service is a very good and in the end VERY CHEAP to have all of us being able to recommend this radio !!

Just my thoughts .

I agree that this could be a winner if it worked. The CW is a must have for me, as of right now the rig is a paperweight. I've noticed, and I've seen others mention, the connectors used for Microphone and Keyer are of the lowest quality I have ever seen. I have to rotate my connector into the keyer until it makes contact with the ring. The microphone connector has no positive connection, so it tends to not be plugged in more than it's plugged in. The keyer is a joke, but straight key is fine, if it actually detected the difference of having a stereo vs mono being plugged into it. And, oh yeah, the AGC. Wow, I suppose there's quite a list. Is this even all fixable??

Has anyone put a scope on the keyer to observe dot/dash/element spacing?
If not, I'll try to get to it Tuesday. It doesn't sound right, but the fix should be just adjusting timing loops in firmware- another item for the list Charlie- eh?

I would say so Dale , said the same thing right after I got mine and first tried setting up the keyer . Your observation is dead on with mine . It is on my list to look at with the scope just haven't made it through the list yet :)

I am starting to get quite a test bench devoted to just the X1M :)

Thanks for confirming my observation , makes me feel better knowing that someone else agrees with my assessment .

Air check with buddy on ground wave, 40 meters, vs. CW suggests I need to turn up the audio a bit. Before I get into it, CW, or CCW on the pot, and a little 1/4 turn, or more? I'll fire into a dummy load and monitor with another receiver with the antenna shorted. I am getting pretty good "kicks" on my SWR meter, but I think I could squeeze a little more out of the rig.

Any thoughts??

OK. Charlie says that there is a "sweet spot" on the pot, which seems to be the case. Definitely worth my while to have adjusted it. Air check with local ham indicated that voice level was a little weak in knees.

Thanks!

That's a tough call Paul. Unlike AM, the amount of power in an SSB signal is totally dependent on the amount of audio. No audio= no power. So how does one tell its "weak in the knees" and not just band conditions, the rig being QRP or a poor antenna?

I've never been much of a fone guy. Isn't this a case for the old "two-tone test" and a 'scope to determine how much signal we can push before distortion begins? Then, if I remember correctly, the "average" voice will generate about 40% of that for output if you don't use speech compression, which I don't think X1M has. Does that sound about right? I've only made two SSB QSOs so far (NH and Maine) and I haven't played with the audio level at all yet.

OK. Charlie says that there is a "sweet spot" on the pot, which seems to be the case. Definitely worth my while to have adjusted it. Air check with local ham indicated that voice level was a little weak in knees.

Thanks!

Air check with buddy on ground wave, 40 meters, vs. CW suggests I need to turn up the audio a bit. Before I get into it, CW, or CCW on the pot, and a little 1/4 turn, or more? I'll fire into a dummy load and monitor with another receiver with the antenna shorted. I am getting pretty good "kicks" on my SWR meter, but I think I could squeeze a little more out of the rig.

Any thoughts??

> That's a tough call Paul. Unlike AM, the amount of power in an SSB signal is totally dependent on the amount of audio. No audio= no power. So how does one tell its "weak in the knees" and not just band conditions, the rig being QRP or a poor antenna?

Gave him a "key down" on CW for comparison, which will be full power.

> I've never been much of a fone guy. Isn't this a case for the old "two-tone test" and a 'scope to determine how much signal we can push before distortion begins? Then, if I remember correctly, the "average" voice will generate about 40% of that for output if you don't use speech compression, which I don't think X1M has. Does that sound about right? I've only made two SSB QSOs so far (NH and Maine) and I haven't played with the audio level at all yet.

Yes, that is my understanding. After I had increased the microphone level, I got peaks about 1.5 to 2 x more than before, and closer to the 40% number. Voiced consonants have more energy, so that was my test.

Don't have access to a 'scope, or I would have definitely done that. If I have too much (distortion), then I know how to cut it back.

1158. X1M-PRO DX Video, my Mods, and a new Firmware feature request...

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-08-29 08:43:12 UTC
From: pezcat19
Topic: 1158 Message: 1158

Hi all,

I have had my X1M Pro for a couple of weeks now and I have been enjoying (mostly) the rig. As we know it has a few design/firmware issues, but it is mostly great on SSB.

Today my AlexLoop Walkham arrived in the post. I have been procrastinating about this antenna for a couple of years, but I finally decided to purchase one. I assembled it in my backyard and tuned it for 20m, which as my first attempt only took about 3 minutes. I had not been on the air longer than 5 minutes and this video was the result! A long-path "55" contact with IZ7NLJ (Italy). That is roughly 15152 mi or 24385 km from my location here in VK3 (Melbourne, Australia)!!!

Check out my poor quality video here: http://youtu.be/JieeidauIDE

FYI; I have made the following mods/improvements to my X1M PRO:

- I replaced the BNC with an SO239. I have no idea why so many people voted for BNC version, as for portable use the SO239 is stronger and provides a rigid connection for QRP antennas such as Miracle Whips, ATX Walkabouts, etc... (For a bench-top radio, BNC is fine).

- I re-seated the speaker and spaced it slightly off the PCB with some foam tape and hot melt glue. I also tightened the loose PCB screw at the rear of the top board, as it was vibrating on loud audio.

- I adjusted IF Offsets and BFO's. SSB works well now (I do not use CW, except for tuning up! hihi)

- I lowered the sidetone (also affects the 'Keybeeps' :)

- I have tried various knobs. The ones on there now are OK but still not exactly what I am after.

- Added rubber feet

- I straightened the LDC as it was so are out it has giving me a sore neck :)

- I cleaned the soft key contacts as the LK/SYS key was very intermittent.

- I Potted the microphone plug

- I Used a black sharpie to color in the speaker holes.

So the rig is far from perfect, but it's damn good fun for the price! I hope a Firmware update will appear to resolve IF offsets and the CW bug.

Speaking of Firmware, I would also like to remove the TS+ and TS- buttons and have this 'digit select' feature performed by the VFO push switch (eg, Push to "blink" the selected digit, and rotate the VFO again to choose the one you wish to change (left or right), then

push again to lock it in as begin tuning!). Make the current F1 and F5 keys "Menu +" and "Menu -", (to do the job the VFO Push currently does), and then I can tune quickly with only using the one dial only!!! I think this would improve the operation of the radio significantly. What do we think gang? Would you and can we vote for this in a FW update?

Hi Perrin,

Apparrently the BNC is a USA thing, and the SO-239 is EU/JA.

We're lucky here in Australia that we have the choice of either model, and it appears that so far it's roughly 50/50. The Australian models<http://sites.google.com/site/spooktechengineering/ham/qrp-hf>are all re-aligned prior to shipping so it can be used right out of the box
without having to 'tinker'.

Having played with both BNC/SO-239 models, I must admit that I prefer the SO-239, but that's typically only because that is what I have most of in the shack. RF wise, the BNC is a superior connection, though at HF it's much less critical, so therefore it really comes down to personal preference.

Many of the SOTA guys seem to like BNC as that's what they have used for the FT-817, but then again, some 817 users still prefer the SO-239 (even though it draws more current to drive a relay for its use).

I like your idea of using a permanent marker to colour in the speaker holes. So simple yet effective. One of the first commens i'd heard from fellow hams (other than shit that's small) was that the holes on top look a bit dodgy.

Hi Heath,

All agreed mate. With regards to the SO-239, I always use this for HF on my FT817, and always the BNC for V/U. As I use extra LiPo packs, the extra current consumption for the SO-239 relay is not an issue for me.

It's funny regarding the size of the rig, as despite all of the photos and videos I looked at, the rig was still much smaller than I expected when it arrived. (This is a good thing!)

I believe you have contact with the manufacturer? What do you think about my VFO tuning/digit select idea?

It's great to see you stocking and aligning the rigs in VK too!

I like the use of a sharpie to take care of those shiny speaker holes.
Hadn't figured out a good way to deal with that.

BTW, I think putting the feet on jacks it up enough to improve cooling.
My perception is that it now doesn't run as warm.

How did you clean those switch contacts? A couple of mine aren't all
that good. Takes a couple of pushes sometimes.

Thanks!

A counter sink was apparently used to remove the burr on drilling the holes, which accounts for most of the "shine." Just did the marker thing -- had one with a tapered round tip -- does the trick.

If they had punched the holes instead, it might have looked better, so the burr would have been on the inside, out of sight.

The alignment took maybe 10 minutes, so that really isn't a big deal. Forced me to learn a little more about how the rig really works, and build up confidence level.

Hi Perrin,
I am in the midst of modifying a classic QRP rig here- the S&S Engineering ARK-40. This was an expensive monoband rig from the 1990's and featured a wonderful, spur free synthesizer. The downside was that you had to tune it via 4 BCD thumbwheels.
http://k8ld-qrp.blogspot.com/2011/01/ark-40.html

So, my conversion uses a Basic Stamp BS2 micro and converts optical encoder pulses to BCD and an LCD display. Anyway, I am making use of the encoder pushbutton to select different tuning rates and it works wonderfully and is very intuitive.

Hi Paul et al,
Obviously, they are buying these extrusions with the powder coat already on them. I believe a die to punch the holes would mar the surface requiring a repaint.
My solution is to cut out the entire circular area of the speaker with a fly cutter on my vertical mill. I have, arriving today, an injection molded black speaker grill that will then cover the opening- and should allow more of the speaker's audio out.

Hi Paul,

With regards to heat, my X1M-PRO stays cool when I run it with less than 12.2 volts (roughly). At 12.6v, it starts getting rather warm, and I would imagine that at 13+ v it would get very very warm.

My X1M has been working down to 11.5v with no problems. I have not performed any tests on its performance and different voltages, but regardless the heat seems directly related to the input voltage. The rubber feet probably do help a little with cooling.

To clean the switch contacts I use electronic contact cleaner (in a spray can) applied to a toothbrush or a clean rag to wipe the contact area under the rubber pads. This was all it took to fix my buttons.

Cheers,

Perrin

I don't recall this particular problem being discussed . My first thought is to do a general reset .

However various other "strange" and stray "not commonly experienced or reported" have been linked to bad connections between the front panel and the board . I would try seating that again to see if the problem goes away . Maybe a shot of Deoxit contact cleaner on the connectors if you have some .

Please keep us informed and we will attempt to help you .

I have not heard from Ed at all this week , so I suspect he may very well be tied up elsewhere , he is normally very good at answers to my e-mails .

Sorry Kent , I forgot to address the power jack issue . The wrong sized plug is included with the radio . You need one with a smaller diameter inner hole . I had one here I took all the way down to the board to make sure it wasn't an issue with the radio side connector breaking away from the board .I don't remember all the metric sizes right off hand. I am fortunate that I have a well stocked bench and had the right connector on hand .

I think someone posted a Radio Shack part number for the correct plug . Check and see if that is the problem that you have too.

You want a 5.5 x 2.1 mm plug. The "standard" one for most QRP gear.

I think, but not sure that it is a Rat Shack "M" plug.

Don't know why I haven't tried this before now. Just had a decent cw chat with W7GVE in Arizona with my X1M and OCF dipole. Guess I've grown lazy and accustomed to the radio doing the work - it finally hit me I could work split manually, using the VFO A/B switch as a sort of T/R switch. I called CQ on 14.060 - QRP calling freq - and used the other VFO to listen up 600Hz in order to get an audible beat note. Not great, but it worked!
Per Australian suggestion, I turned down the voltage on my power supply in the shack, and ran the X1M at 12.0 V. It does run quite a bit cooler, and I still get 5W out on 80 and 40, and about 4 on 20 meters per my WM-2 QRP wattmeter. Close enough.
Pleased with this success, I'm going to quit while I'm ahead and QRT for today.
G'Night, y'all!
Ken, W1KRT

Congratulations Ken !! At least it is a viable work around for the present time .

Heck still a lot simpler than my days as a novice with my home brew transmitter and my S-40 receiver . The guy I was working and I might have crystals 5 kHz. or even more apart and a knife switch for changing the antenna between the transmitter and receiver . Switching the receiver from standby , you almost needed a flight check list :)

I got my knob in the ail today and it looks great! It is so much more comfortable to turn and fits right on! No modification necessary for push button use. I uploaded a photo of it on the x1m if anyone wants to take a look! A great $5 upgrade! I actually kept my red faced knob for volume/power for now because it was easiet to turn and grab with the mic plugged in the than the old tuning knob.

Yes, but not quite as elegant! <grin> I was an Engineer in my previous life. My XYL has me in a 12 step recovery program. It does not work...

I got 10 (!!) pieces of the knob that is pretty much like the frequency change knob, so messing one up is not a big deal...

Anybody else get a chance to try out on of Ed's audio filters? Got mine yesterday. Goes a long way toward narrowing up the band pass for CW signals. Looks like a "knock off" of the NESCAF filter, from what I can determine.

Hi Charlie

Tried reseating the front panel connectors this morning no change! During disassembly I noticed that the volume and tuning control nuts were barely finger tight if not loose.. It also appears that , what I assume to be the heat sink screw on the bottom has been mistreated..(read galled a bit).

I suspect they are having some Quality Control issues?

Anyway..no word from Ed yet!

A little disappointing as I have the weekend off and no new toys to play with!! Hi Hi

Have a Great Holiday!

Perrin and Heath,

It is not necessarily an American thing to have a BNC. The SO-239 IS an American thing, not a EU/JA thing. The SO-239 was invented in the USA by Amphenol during WWII. The reason for choosing the BNC over the SO-239 is simply that the chinese as well as others are incapable of making the connectors correctly, they bastardize it and use something called the metric system to measure with and since they can't make a SAE SO-239 then we have to use the BNC. The chinese SO-239 is metric, our PL-259 connectors are Standard American Equivalent. They don't screw together. The BNC is also an American invention, but since it has no threads then I guess it's not too difficult a concept for the chinese to grasp. The BNC is a better connector though because it is better shielded than a SO-239/PL-259 combination and it is quicker to disconnect.
Since the first X1M's came to the USA with metric SO-239's and we couldn't use them, folks pulled them off and installed SAE SO-239's or BNC's and when Ed came up saying the people at the factory could put BNC's on them, the group here voted to have BNC's put on rather than some garbage we couldn't use.
Can you tell I'm not a fan of the metric system?

John,
Having lived in several "metric" countries, I have no dislike at all for the metric system and found it easy to adapt to. The only problem with it is that we Americans haven't yet caught on and fully adopted it. IMHO.

Hi Perrin,

I beleive your tuning digit idea has some merit, though I'm not sure if I would prefer it that way. I wonder if you have ever used the non PRO version? The way you suggested is how it was done on the older versions.

I guess that in an ideal world, we would have the option to 'user program' each button as we see fit. Is this wishful thinking?? :)

Yes I have been feeding back many points people have made on this list back to the manufacturer with the hope of updates/fixes. They're flat out so we'll just have to see what comes of it.

On his web site. see this:

http://www.wouxun.us/item.php?item_id=305&category_id=65

I admit to not caring for the finish, or lack thereof, of the front panel, so simply reversed it (to save the lettering, if I didn't like what I had done), deburred the holes a little, and gave it a nice coat of white appliance epoxy, which stick to aluminum. Added vinyl feet so that it wouldn't scratch the X1M, which it is sitting on top of.

Try using Spectrum 2 to take a look at its response.

Looks like a knock-off of NESCAF filter, but really nice packaging.

Check the actual pins on the front panel connections. I had one that was not bent but shoved back and was making intermittent contact. This was causing a problem with output only on USB.

Heath,
Not too long ago I purchased a Chinese VHF FM transceiver under the brand name 'TYT'. It does allow the operator to select the functions he prefers for five pushbuttons, giving 15 selectable functions of choice. For each of the five programmable buttons, there is a different function if you push, push and hold 2 sec, or first hit Function then push. The idea of "Push" and "Push and Hold" is used by several manufacturers. The Pro already uses the distinction between "Push" and "Push and Hold" for the Lock/System key. Making the functions programmable would be icing on the cake. Something to consider for the X1M, or maybe the Mk II.
Right now, though, there are other issues which deserve higher priority for the firmware programmer(s).

I have experienced the pin problem . One needs to make certain that they are correctly lined up and I even manipulated some of mine to add a little tension to them because some are not a snug fit .

I would NOT recommend ANYONE taking the screw out of the bottom .

IF you do separate the top and bottom boards WARNING WARNING WARNING (I guess this should include the bottom screw in the warning)

Take a VERY VERY careful look at the connector between the two boards . The connector joining the two boards has fewer pins than the connector on the board . It is in a difficult position to see and difficult to reach to manipulate when joining them back , so personally I would advise NOT to separate the boards . You CAN put them back together and EASILY be off by one pin !!! I don't know the consequences of doing that and am not eager to find out . SOOOOOO YOU HAVE BEEN WARNED !!

I am on the road and not returning home until Monday . I do have the PRO with me and am squeezing in some portable style operating with it . Hope to work some of you on SSB .

It is on Ed's page for Import Communications. I think Paul posted the URL . What I have been able to use it so far , it is a nice addition to ANY radio needing additional filtering.

No Beeps at power up etc no sounds whatsoever except the relays at power on and band changes.

Hi Ken, yes I used to live in Australia, I have family there as well as in Europe and I have adapted as well, a 1/2 inch wrench fits a 13 mm bolt and a 9/16 wrench fits a 14 mm bolt. With metric it takes 15 wrenches and with SAE it takes 7-8 wrenches to do the same job. I remember the days before we had these stupid metric cars.
What bothers me is that the only thing they change is the threads on the metric SO-239 in china, everything else is same size no matter how you measure it.

Hi Kent,

I had a bit of a scare with the audio on one of my PRO's. I had it set up on a WSPR frequency for a few days, using the audio out socket on the back. When I removed the cable to do some tests, and I noticed there as no audio out. After trying a few things, replugging and unplugging the cable a few times, the audio eventually came back.

So, if you've had a speaker or phones plugged in, and now you've lost audio, this is what it may be.

1193. Audio Compression 'Accessory Circuit' Idea to Increase SSB Output

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-01 17:38:02 UTC
From: <orders@...>
Topic: 1193 Message: 1193

Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip: http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

Great attitude, Chris! I'm not familiar with that IC, but it sounds as though it has the functions you are seeking. Reasonable compression will add substantially to your "talk power." Like most things, it can be overdone and degrade your signal. Sounds as though you are tackling the learning opportunities this little rig offers with zest and enthusiasm. Have fun and enjoy the trip!

Hello,

I'm still waiting on word. I got a reply from Dale on August 20th:

"They sent Ed only half of what was ordered. We should have some within a week or less. We have been pulling our hair out waiting on these. I will be in touch soon
Dale"

So yeah, just waiting.

1202. IF Offset / USB BFO / LSB BFO settings

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-02 07:57:20 UTC
From: Heath - VK3TWO / VK6TWO
Topic: 1202 Message: 1202

Hi all,

I've just uploaded a new alignment proceedure in the files
section<http://f1.grp.yahoofs.com/v1/3EMkUtBIdR5OTqoTtXq5iz30Yj3d0ghrelhHZiJ84HpSLYWHGQuUSba0WdyD2eV_IaIU8GAxQLJyfsSw4xp0921A4g/Manuals/X1M%20PRO%20-%20Alignment%20Procedure%20%28LSB%20Fix%29%20-%20By%20Heath%20VK3TWO%20-%20V1.>
.

It details a VERY EASY method of fixing the LSB BFO problem, and aligning
the IF Offset.

Please give it a try and let me know what you think. Any suggestions
welcome.

Hi Heath,

This procedure looks great!!! Thanks for putting the time and thought into a procedure for those of us that don't have an extensive test bench! I'll give it a go and let you know how it goes for me.

I'm actually excited about dialing this all in with your procedure so that is something!

John -

I totally hear you! My first one showed up partially working. USB worked CW didn't and some things were lose and rattling about. So it went back. Not being able to fully play is a killer.

Hope yours arrives soon as May is a long time in the tooth to be waiting!!!!

The more and more I look at this the more and more I want to play with little chip but it is in a tiny tiny MSOP package. And my soldering skills/hand steadiness is NO WHERE near close enough to jump right in. Anyone have a great easy way to put an MSOP chip onto a breadboard or anything like that? I've seen some 'easy' convertors for SMD chips but none for MSOP -- and I guess I haven't looked to see if they would work. Anyway -- if anyone has any great suggestions I'd appreciate it!

Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

Thanks Heath!

It's great to see folks with a well stocked bench helping those of us out that aren't so well prepared for the DIY aspect of this fun little rig! I haven't given mine a good alignment yet so I'll give it a whirl and see how it goes.

Subject: [X1M_QRP-Transceiver] RE: Audio Compression 'Accessory Circuit' Idea to Increase SSB Output

The more and more I look at this the more and more I want to play with little chip but it is in a tiny tiny MSOP package. And my soldering skills/hand steadiness is NO WHERE near close enough to jump right in. Anyone have a great easy way to put an MSOP chip onto a breadboard or anything like that? I've seen some 'easy' convertors for SMD chips but none for MSOP -- and I guess I haven't looked to see if they would work. Anyway -- if anyone has any great suggestions I'd appreciate it!

Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip:

http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. Hello Chris,
Yep, I've been chomping at the bit to get my replacement. The first one had a bent pin in a front face connector. I probably could've fixed it myself, but when a warranty is involved it goes back. As for the length of time, yeah . . . I'm patient. But I've never had to wait this long for an order or replacement before. You can't blame the seller in this case though. Never the less, the wait is frustrating.

John

Great Lee! I'll check those out and it is good to have a partner in crime on this one!

I've been laying out my circuit in fritzing (http://fritzing.org/download/) as I figure out what components I need. It isn't a circuit simulator but just a documentation tool. I'm using it like a big note pad as I add bits and keep track of what I think I'm going to need. There is more than just 2 extra resistors needed there are a caps that need to be in the circuit too and it runs at 3v so a 3v regulator will be needed...

According to someone else they measured the line voltage as 7v into the hand mic. So I'm hoping that the 2ma it draws at 3v works and doesn't add grief. Then it is a preamp WITH the compression and noise floor options... so it might be a matter of turning down the internal gain if it comes to that.

That is where I am at in my brain as I read over the spec sheet. Look forward to hearing your results, etc!
And I'm gonna go look at getting some parts on order too...

Hi Group,
Might want to take a look at the compressor that Phil Salas built for his Ft-817 using the SSM2165 chip. May give you some ideas.. Here is the link to his web page:
http://www.ad5x.com/articles.htm

Look down the page to "Miscellaneous" and see the entry "Speech Compressor for Dynamic Microphones (http://www.ad5x.com/images/Articles/SSM2165.pdf)".

I believe there are still some of the DIP versions for sale on eBay, which are a lot easier to work with than the SMD size chips.

Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip: http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.htm

l

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

Thanks for that link Roger! Inline that is exactly where I was dreaming down! I saw that chip line but saw that it was discountinued -- never thought to ask mr old ebay if they had any laying around. Looks like it does although for a price premium:

http://www.ebay.com/itm/AD-SSM2165-1P-DIP-8-Microphone-Preamplifier-with-Variable-/271220069021?pt=LH_DefaultDomain_0&hash=item3f25f9d29d

9+4 shipping for 1!

Also -- that might give us some places to start in few of the values in regards to how much gain to put into it.

Hi Group,
Might want to take a look at the compressor that Phil Salas built for his Ft-817 using the SSM2165 chip. May give you some ideas.. Here is the link to his web page:
http://www.ad5x.com/articles.htm

Look down the page to "Miscellaneous" and see the entry "Speech Compressor for Dynamic Microphones (http://www.ad5x.com/images/Articles/SSM2165.pdf)".

I believe there are still some of the DIP versions for sale on eBay, which are a lot easier to work with than the SMD size chips.

Great Lee! I'll check those out and it is good to have a partner in crime on this one!

I've been laying out my circuit in fritzing (http://fritzing.org/download/) as I figure out what components I need. It isn't a circuit simulator but just a documentation tool. I'm using it like a big note pad as I add bits and keep track of what I think I'm going to

need. There is more than just 2 extra resistors needed there are a caps that need to be in the circuit too and it runs at 3v so a 3v regulator will be needed...

According to someone else they measured the line voltage as 7v into the hand mic. So I'm hoping that the 2ma it draws at 3v works and doesn't add grief. Then it is a preamp WITH the compression and noise floor options... so it might be a matter of turning down the internal gain if it comes to that.

That is where I am at in my brain as I read over the spec sheet. Look forward to hearing your results, etc!
And I'm gonna go look at getting some parts on order too...

I ran across another option last night....

http://www.proto-advantage.com/store/product_info.php?products_id=2200031

Its a MSOP to DIP coverter kit -- but the cool thing is you can have them order your IC from digikey and mount it on the board for you. It looks like to get the current SSM2167 the total cost is about $19 shipped. Which is what most sellers are selling the older model in a dip package on ebay for -- that one I posted earlier being the exception at like 14.

I really don't love the idea of designing as new circuit around an end of lifed chip so I'm thinking I'm going to look at getting on premounted for proof-of-concept step 1. Then if it works great -- figure out how to make it smaller and better suited to inline work if the adaptor board doesn't.

Thought I'd share that with the group.

I ordered 2 of the chips on eBay, just in case I kill one, and some chip adapter boards from the same seller. Put item number 181138215223 in the search box to see then.

Subject: [X1M_QRP-Transceiver] RE: Audio Compression 'Accessory Circuit' Idea to Increase SSB Output

The more and more I look at this the more and more I want to play with little chip but it is in a tiny tiny MSOP package. And my soldering skills/hand steadiness is NO WHERE near close enough to jump right in. Anyone have a great easy way to put an MSOP chip onto a breadboard or anything like that? I've seen some 'easy' convertors for SMD chips but none for MSOP -- and I guess I haven't looked to see if they would work. Anyway -- if anyone has any great suggestions I'd appreciate it!

--- In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:
Thank Ken! Yup I'm thinking with 5 w I'm going to want the most talk power for the punch of my voice. Although I haven't done the math to see the difference between 0.5w and 5w. if my db brain remembers it probably isn't that much ! much like the difference between 5w and 100w ;) But I suspect it is bigger if I compare 0.5 w to 100w ;) And the goal is to get it as compressed and gained right to point before degrading! And we will see where that lands

me! And to top that off the neighbor in the new apartment is really sensitive to me talking at night -- she has come twice at 1am to ask me to keep it down while conversing with a friend at lower than normal voices already. So the more punch I can get out of the mic at lower levels the more I can work in the nighhhhhhht!

And thanks for the thumbs up I'm loving the trip!

Great attitude, Chris! I'm not familiar with that IC, but it sounds as though it has the functions you are seeking. Reasonable compression will add substantially to your "talk power." Like most things, it can be overdone and degrade your signal. Sounds as though you are tackling the learning opportunities this little rig offers with zest and enthusiasm. Have fun and enjoy the trip!
Ken, W1KRT

--- In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:
Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip: http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

From: Dale
Topic: 1220 Message: 1220

Has anyone else looked at, say USB while operating LSB on a spectrum analyzer?

I did so briefly- I was doing a test set up for something else and took a quick look on the spectrum analyzer. It showed that the TX audio was a bit restricted- no surprise there with the mic that comes with the rig, but there was a lot of USB energy when I was on LSB. I have the IF set close to the 1100Hz offsets. Something to look into. We are not likely to get QRM reports with the 5W of power but, if true, this is wasted energy well outside of the receiving station's passband.

From: Charlie , W5COV
Topic: 1221 Message: 1221

I posted the information about this being a great transceiver for those of us that use the experimental bands below 2 MHz.
on my Yahoo group part15 (no space between part and 15). One guy from the USA in Arizona jumped on it and ordered one and several others are looking at it , because even as it is it works fine for even CW beacon use and now can serve as an exciter for many of our experimental modes and on those bands SSB is a bonus .

I had another inquiry this morning from a member in Europe , the UK , that wants to buy one , but doesn't know if there is a dealer/distributor for Europe and who it is so he can buy one too .

Any help would be appreciated , "our season" starts the 1 st of September . Pretty solid simple method of the true active , successful months that define our season . ONLY the months with an "R" in their spelling are truly useful , especially for those of us that hang around the part 15 experimental "watering hole" 185.300 kHz. with most stations running QRSS60 and a few running QRSS30 .

Activity on 2200 meters , 1750 meters , and 630 meters . You can find out more at www.lwca.org The X1M has impressed me so far with what I have heard on 630 meters . Looking forward to the 1750 meter beacons getting back on the air for winter to see how it does there . They are VERY restricted under part 15 , but simple , cheap and easy to get on. My beacon with 1 watt INPUT has been captured with ARGO and Spectrum Lab , out to 1500 miles .There is also 4,000 Meters , but it is below 100 kHz. so the X1M doesn't quite go that low .

1222. Still no output on SSB

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-03 17:29:02 UTC
From: Mark Thompson
Topic: 1222 Message: 1222

Well, I thought I resolved the problem when I found an intermittent contact between the front display board and the upper main board. Was working great but it now seems like when it warms up the output is once again greatly decreased to 1 watt or less. From cold it works fine but after about 20 minutes even in just receive, I loose my output on SSB. Any ideas before I pack it up and send it back to Ed?
Tnx & 73

1229. RE: XM-1 Opposite Sideband Energy

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-04 01:28:32 UTC
From: <w9rws@...>
Topic: 1220 Message: 1229

The only way I could get really good opposite sideband surpression was to move one of the sideband offsets much more than 1100 off to the side of the center IF filter setting. Looked good on the Flex spectrum scope and sounded nice and crisp also, but with it that far off center, could never get the opposite sideband readout to sync up and still sound good, so just balanced upper and lower to look and sound pretty much equal with the same surpression and left it with that compromise (IF set at 99650 and SSB offsets about 1150 off center). Could get surpression on both sidebands but then of course readout was bad on one. Guess that's the best we can do with that filter, but I agree there is energy wasted out there.
If anyone figures out something will try it.

1231. X1M-PRO. New Firmware Available!!! ???

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-04 12:25:32 UTC
From: pezcat19
Topic: 1231 Message: 1231

Hello all,

The manufactures website, http://www.cqxiegu.com/archive.asp , appears to have new Firmware available for download. The translation tells me this is:

"X1M Platinum Edition burning process V1.00bBuild010 (USA shipments) 20130807.exe"

The website lists the Firmware as:

File name: update
Size: 62KB [Download]
Update: 2013-8-28 14:55:52

And the GREAT news is that the program is a simple EXE that is looking for a Comport connection to the rig. I wonder if firmware updates will be as simple as connecting to the DB9 and hitting the correct button in the software? (Who here can read Chinese??? Anyone????)

Who is prepared to try this out? It could of course go horribly wrong, but it could, perhaps, resolve a number of issues if it is indeed a new update...

I have uploaded the file to the Files section.

Good luck, have fun and be careful! :)

Perrin VK3XPT

I do not like the new yahoo group look or functionality at all..

Why would they do something like that and not say anything?

Fred

Subject: [X1M_QRP-Transceiver] X1M-PRO. New Firmware Available!!! ???

Hello all,

The manufactures website, http://www.cqxiegu.com/archive.asp , appears to
have new Firmware available for download. The translation tells me this is:

"X1M Platinum Edition burning process V1.00bBuild010 (USA shipments)
20130807.exe"

The website lists the Firmware as:

File name: update
Size: 62KB [Download]
Update: 2013-8-28 14:55:52

And the GREAT news is that the program is a simple EXE that is looking for a
Comport connection to the rig. I wonder if firmware updates will be as
simple as connecting to the DB9 and hitting the correct button in the
software? (Who here can read Chinese??? Anyone????)

Who is prepared to try this out? It could of course go horribly wrong, but
it could, perhaps, resolve a number of issues if it is indeed a new
update...

I have uploaded the file to the Files section.

Good luck, have fun and be careful! :)

Oh! It's not just me. I thought I had inadvertently changed something on my computer. I agree: the new format is a step (or several) backward.
On a more cheery note: the firmware update stuff sounds promising! I wish I had kept up with and improved the Chinese I studied 40+ years ago. Oh well, never too late...

I agree Fred, but lets try to keep this thread on topic!

I have just uploaded to the "Firmware" folder, a rough translation of the firmware tool software buttons.

Is anyone brave enough to try this firmware burning? I live in VK so I am not going to take the chance until someone else does. Ed is a long way away from here ;-)

IF someone is prepared, PLEASE note down your firmware version FIRST, by pressing and holding the F5 key for a few seconds...

Cheers,

It is kind of on topic as the link from this end to the software is not obtainable nor is the folder.

I am going to restart my computer, empty cache and see if the destination can be had to get the file.

I've tried. The problem is that it will put out full 4-5 watts for awhile then all of a sudden drop to less than 1 watt and stay that way until the unit cools down only by turning it off. A new problem has now arisen. Same problem with transmit cutting out is now happening on receive. I wonder if the chip that gets so hot has failed and caused othrr surronding components to also fail. I could not get a temp reading on this chip with my digital thermometer because it was way above 120 degrees.

Perrin , and group ,

If I can find a good enough set of instructions and it can be done VIA com port , I will certainly be happy to try it . If it requires reburning a device I'll have to see what the device is and if I have a burner . I have several .

1244. X1M MDS Testing.

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-04 16:01:16 UTC
From: Dale Parfitt
Topic: 1244 Message: 1244

I did some quick MDS (minimum discernible signal) tests this morning. Part of this was to see what the typical loss is in the front end L-C filters. This can be accomplished because when you go outside a hamband the filter for that band is bypassed.

Anyway, on 10M the MDS with preamp was -132dBm and -122dBm w/o preamp
on 80M it was -130dBm w/ and -120dBm w/o.

Going just above 80M to bypass the 80M filter, the spec was -143dBm w/ and -136 w/o.

Signals were obviously very weak and I used headphones. LIkely these numbers would be considerably lower with the internal speaker.

So there is enough front end sensitivity, just not enough system gain- particularly if AGC is to be implemented.

Dale W4OP

Anyone have any word if they are going to throw a bone to those of us with the ver II with a firmware upgrade there too? I wonder how many of us there are out there vs PRO owners in general.

I'm not expecting much to be honest but it would be a great geasture from them for those of us who gave feed back that got incorporated into the new device... that we don't have.

I'd even be ok if this is something I'd have to go through Ed to get/do.

I am also curious about how those of us with the version 2 model will be supported. I was told by Ed, that there may be a front panel upgrade kit, but I'm not sure if this changes anything other than the display, and buttons to the newer style. What I would really like is to be able to use the radio on the 40M phone band, as well as having 75M extend all the way to 4 MHz. Can we get some specifics as to whether our model is also updateable? As an alternative I'm looking into making myself a switchable LPF box for 40M and the WARC bands.

All,

Just attempted the firmware upgrade with limited success.

The process all seemed to work, and the radio appears to work, however it's buggy. (Doing this will void your warranty!)

I'll do some more testing to see if anything has improved/failed and post an update.

I'll also post a video on youtube of my semi-failed attempt

Can they provide a file for you to restore it to the firmware version
that you attempted the upgrade on ? It would be nice if some of our
programming guys could get a look at the code . I am not one of them ,
but we have some pretty sharp programmers I am sure in this group .

Will be looking forward to your video .

It would be great to get source code but I doubt that will happen. If we had the source code it is POSSIBLE some brave souls could update and edit the MCU in the ver II ones as well.

Neil I';m right there with you! Honeslty I don't care about the new interface or buttons. I rather like the old simple ones I have... what I do care about is extending the filters range to US bands, and the offsets, etc.

I too was looking at the alternative of making an external LPO set - in my little dream world over here I'd make a single box that houses all the 'extra' circuits that aren't in the rig -- like the mic circuit, the LPOs, and so on. A nice little buddy box as I keep calling it.

Obviously I would prefer that only be for the WARC bands and not have to add in this for the very tail end of the 40M band and I think there is one other that is cut off too. Anyway -- if you go the LPO route let us know about it and I hope we can get a firmware upgrade for the v II's as well.

--- In X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com> wrote:

I am also curious about how those of us with the version 2 model will be supported. I was told by Ed, that there may be a front panel upgrade kit, but I'm not sure if this changes anything other than the display, and buttons to the newer style. What I would really like is to be able to use the radio on the 40M phone band, as well as having 75M extend all the way to 4 MHz. Can we get some specifics as to whether our model is also updateable? As an alternative I'm looking into making myself a switchable LPF box for 40M and the WARC bands.

I bit the bullet and ordered a ssm2167 on a breakout board from them. I decided against soiling my playing with bad soldering fruseration for the moment and instead will forgo the extra coffee one day. I'm thinking and inline version would be the most useful to start out -- plug the mic into the inline box and then have a tail from the board into the rig. There isn't any room in the rig to stick it easily and putting it directly into the mic would limit it to one circuit per mic... also not flexible. The other option is a larger block in the middle of the mic cable but that seems the wrong way.

Anyone have any thoughts on a performed form factor for it?

The more and more I look at this the more and more I want to play with little chip but it is in a tiny tiny MSOP package. And my soldering skills/hand steadiness is NO WHERE near close enough to jump right in. Anyone have a great easy way to put an MSOP chip onto a

breadboard or anything like that? I've seen some 'easy' convertors for SMD chips but none for MSOP -- and I guess I haven't looked to see if they would work. Anyway -- if anyone has any great suggestions I'd appreciate it!

-Chris

--- In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:
Thank Ken! Yup I'm thinking with 5 w I'm going to want the most talk power for the punch of my voice. Although I haven't done the math to see the difference between 0.5w and 5w. if my db brain remembers it probably isn't that much ! much like the difference between 5w and 100w ;) But I suspect it is bigger if I compare 0.5 w to 100w ;) And the goal is to get it as compressed and gained right to point before degrading! And we will see where that lands me! And to top that off the neighbor in the new apartment is really sensitive to me talking at night -- she has come twice at 1am to ask me to keep it down while conversing with a friend at lower than normal voices already. So the more punch I can get out of the mic at lower levels the more I can work in the nighhhhhhht!

And thanks for the thumbs up I'm loving the trip!
-Chris

--- In x1m_qrp-transceiver@yahoogroups.com, <krtdowns@...> wrote:
Great attitude, Chris! I'm not familiar with that IC, but it sounds as though it has the functions you are seeking. Reasonable compression will add substantially to your "talk power." Like most things, it can be overdone and degrade your signal. Sounds as though you are tackling the learning opportunities this little rig offers with zest and enthusiasm. Have fun and enjoy the trip!
Ken, W1KRT

--- In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:
Man oh Man! Am I loving this little rig! Not because it is perfect and a great value out of the box but for the exact reason I bit the bullet and bought it before it was all polished: Great learning rig! Every time some limit or question is hit I have a reason to go digging and exploring around in the bits that make radios tick. I'll be happy to get my fully functioning rig to actual work on the air but this is a little gem in my eyes for crackin' open the door to learning about radios!

Anyway, my newest exploration is around the audio and SSB and this little fellar. From what Ed has walked me through I'm beating down the path that the radio WILL transmit 5w PEP on SSB .. the mic, gain, compression, preamp, etc are the limiting factor to making this usable out of the box. I'm currently playing down the path that the gain adjustment in the rig will be sufficient if I can compress the audio so more of it is towards the 5W 'section'. During my dive into this sort of theory I can across this little gem of a chip:
http://www.analog.com/en/audiovideo-products/audio-amplifiers/ssm2167/products/product.html

Hot diggly! An IC that does compression, noise gating, and conditioning all on one chip! And the ratio being controlled by a single resistor.....

I've got plenty more to do to see if this theory will be valid in the x1m and how it all fits together but I'm loving this rig just for giving me framework to explore and ask about this things. Before this little fella and my trying to test if the SSB output was 'good' and if I needed to send it back everything was just words and now its all tying together. Having a ball!

Anyway, wanted to throw that IC out to the group in case anyone wanted to pick up a ball around it and run with me too. I'm dreaming of a tiny little circuit that can go inline (or inside if you choose) the mic line and the radio. Set the compression, adjust the gain on the inside of the radio. And BAM an external mod that can be used with other mics, etc but is small enough to stay portable.

THE MICROPHONE PUZZLE IS SOLVED!

I read all the recent discussions about digital mode hookups and the light went on for me when somebody mentioned the bias current being incorrect. That's when it hit me: the X1M needs the extra current draw from the PTT LED in the mic! As soon as I added a red LED in series with 4.7k between tip and ring of the mic plug, my PC headset mic started working.

I now have a very nice little adapter to use my PC headset on the X1M. Here are the final connections:

X1M Sleeve ------------------- (GND) ------------------ Mic Sleeve

X1M Ring ------------ Pushbutton --------- GND
X1M Ring ------------ |< -LED+ ------- 4.7k ----- X1M Tip

X1M Tip ----------- Mic Tip & Mic Ring

The pushbutton acts as PTT when I'm using the headset. When I get around to it I'll add a NO jack across the pushbutton for a foot switch and have full hands-free operation.

Hope this helps anyone who's trying to do something similar. Give me a shout if you have any questions.

73 de KO4XL
Bruce

--- In x1m_qrp-transceiver@yahoogroups.com, <ko4xl@...> wrote:

OK, so last night I bit the bullet and completely traced the circuitry inside the stock mic. The only additional components are:

- A .01uf disc cap across the mic cartridge. I assume this is just there for RF bypass and high frequency rolloff. It shouldn't be required for the mic to function, right?
- A 4k7 resistor in series with an LED between tip and ring. This is obviously the transmit light on the front of the mic.

There are a few other items related to the disabled speaker in the stock mic. For the X1M, none of these are ever in-circuit.

After looking at all this, the only conclusion I can reach is that the stock mic cartridge has much higher output than a PC headset mic. Before I go hunting for a mic preamp, could somebody please prove me wrong?

> Opening the stock mike and using an ohmmeter, I see that ring goes to the PTT switch and tip goes to the mike cartridge. (The other side of both the switch and the mike cartridge are tied to sleeve (ground). At the radio, when PTT is grounded (active), tip goes from open circuit to about +7 volts (relative to sleeve ground). I assume this is the bias voltage needed to power the electret cartrige in the stock mike. However, hooking a different electret cartridge (from a pc headset) across tip and sleeve (yes, I got the polarity correct!) and grounding ring (PTT) does not give me any audio. What am I missing?

If you have blue (flat square/rectangular) push buttons you should have a Pro. If it is a Pro you can push and hold F5 down for a couple of seconds and it will give you the version , package name (Pro) and your serial number is also displayed there .

The version before the Pro , has round black push buttons except for the far right one , which is red .

At least it is good to know that we can update them at home , when they get the firmware corrected .

I wonder if there is more than one update version . I see you mention the F4 button as the "radio information button" on your radio .

The Pro version of the X1M that we have in the USA uses F5 to do the functions that you do with F4.

Here is my F5 Information :

Ver : X1MPRO V1.00b USA
Date : Jul 20 2013
Time : 16:18:40
SN : XG00000042

So do you have one with the USA identifier ?

I am now curious as to how many function buttons that you have and what they do , as well as what your radio information screen shows .

F4 on mine is dedicated to the VFO's , plus the keyer .

F5 is also used to move the arrow under the frequency display in the operating mode , to the right , while F1 , moves it to the left .

ANYONE on the list that has a Pro , have a different version or model information than I do ?

Now I don't know whether to try an update or not , until I hear or see your information and experience .

You're right Charile.

When I first did the procedure, I was using a radio with the front panel removed, so I was going by memory. Knowing that the button closest to the vfo knob was the settings, and the one next to it is the firmware, so I was 'out by one'.

I've corrected it now.

I left the youtube video uploading when I went to bed so that it would upload for you to see ASAP.
Murphy's law, when I woke this morning, the laptop had gone into standby, so sorry for the delay.

--- In x1m_qrp-transceiver@yahoogroups.com, <cvest@...> wrote:

I wonder if there is more than one update version . I see you mention the F4 button as the "radio information button" on your radio .

The Pro version of the X1M that we have in the USA uses F5 to do the functions that you do with F4.

Here is my F5 Information :

Ver : X1MPRO V1.00b USA
Date : Jul 20 2013
Time : 16:18:40
SN : XG00000042

So do you have one with the USA identifier ?

Hi Fred,

As you can see in the youtube video, All i used was the DB-9 to DB-9 adapter (also used for CAT) and a generic USB to Serial converter.

The software automatically detects the COM port, so if you have more than one, you may have to manually change it.

Awesome Bruce! I know mic *has* a red led on the front but I don't think I've seen it come on when I TX. I wonder if my LED is not wired up right and reducing the output of the mic... much like your computer mic without the led in series... I'm going to have to dig into this one. Thanks for the hot tip!/ring/sleeve! (couldn't pass up the bad pun...)

-Chris

--- In X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com> wrote:

THE MICROPHONE PUZZLE IS SOLVED!

I read all the recent discussions about digital mode hookups and the light went on for me when somebody mentioned the bias current being incorrect. That's when it hit me: the X1M needs the extra current draw from the PTT LED in the mic! As soon as I added a red LED in series with 4.7k between tip and ring of the mic plug, my PC headset mic started working.

I now have a very nice little adapter to use my PC headset on the X1M. Here are the final connections:

X1M Sleeve ------------------- (GND) ------------------ Mic Sleeve

X1M Ring ------------ Pushbutton --------- GND
X1M Ring ------------ |< -LED+ ------- 4.7k ----- X1M Tip

X1M Tip ----------- Mic Tip & Mic Ring

The pushbutton acts as PTT when I'm using the headset. When I get around to it I'll add a NO jack across the pushbutton for a foot switch and have full hands-free operation.

Hope this helps anyone who's trying to do something similar. Give me a shout if you have any questions.

Bruce

--- In x1m_qrp-transceiver@yahoogroups.com, <ko4xl@...> wrote:

OK, so last night I bit the bullet and completely traced the circuitry inside the stock mic. The only additional components are:

- A .01uf disc cap across the mic cartridge. I assume this is just there for RF bypass and high frequency rolloff. It shouldn't be required for the mic to function, right?
- A 4k7 resistor in series with an LED between tip and ring. This is obviously the transmit light on the front of the mic.

There are a few other items related to the disabled speaker in the stock mic. For the X1M, none of these are ever in-circuit.

After looking at all this, the only conclusion I can reach is that the stock mic cartridge has much higher output than a PC headset mic. Before I go hunting for a mic preamp, could somebody please prove me wrong?

>
> Opening the stock mike and using an ohmmeter, I see that ring goes to the PTT switch and tip goes to the mike cartridge. (The other side of both the switch and the mike cartridge are tied to sleeve (ground). At the radio, when PTT is grounded (active), tip goes from open circuit to about +7 volts (relative to sleeve ground). I assume this is the bias voltage needed to power the electret cartrige in the stock mike. However, hooking a different electret cartridge (from a pc headset) across tip and sleeve (yes, I got the polarity correct!) and grounding ring (PTT) does not give me any audio. What am I missing?

Hi Heath,

Thanks very much for putting your hand up to do this FW testing, it is greatly appreciated!

Can you please give us some more information regarding the results with the new Firmware? I understand that the serial number changes to FFFFFFF, however does the radio actually work as expected?

I not concerned about the serial number issue if the radio actually works. I am very keen to know if there are any changes to operation, or any bugs resolved such as CW offsets, etc.

Also, have you / can you try the "Re Writable" button in the software? (This is the third button from the left in the software). I wonder if this *might* allow setting of the serial number?

Cheers,

Perrin VK3XPT

I posted the information about this being a great transceiver for those
of us that use the experimental bands below 2 MHz.
on my Yahoo group part15 (no space between part and 15). One guy from
the USA in Arizona jumped on it and ordered one and several others are
looking at it , because even as it is it works fine for even CW beacon
use and now can serve as an exciter for many of our experimental modes
and on those bands SSB is a bonus .

I had another inquiry this morning from a member in Europe , the UK , that wants to buy one , but doesn't know if there is a dealer/distributor for Europe and who it is so he can buy one too .

Any help would be appreciated , "our season" starts the 1 st of September . Pretty solid simple method of the true active , successful months that define our season . ONLY the months with an "R" in their spelling are truly useful , especially for those of us that hang around the part 15 experimental "watering hole" 185.300 kHz. with most stations running QRSS60 and a few running QRSS30 .

Activity on 2200 meters , 1750 meters , and 630 meters . You can find out more at www.lwca.org (http://www.lwca.org) The X1M has impressed me so far with what I have heard on 630 meters . Looking forward to the 1750 meter beacons getting back on the air for winter to see how it does there . They are VERY restricted under part 15 , but simple , cheap and easy to get on. My beacon with 1 watt INPUT has been captured with ARGO and Spectrum Lab , out to 1500 miles .There is also 4,000 Meters , but it is below 100 kHz. so the X1M doesn't quite go that low .

So followed same steps but still no transfer to the radio. Using the adaptor that came with the radio, prolific adaptor..Load program, set baud rate, and the LEDS on the convertor flash, but seems like no data going to radio and no green line across the bottom of program to show it is writing.

1268. RIT Function

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-05 15:28:01 UTC
From: Fred VE3FAL
Topic: 1268 Message: 1268

Ok gang, did the software mod with no real indication of anything different or changes that make the rig usable on cw.

I still have to do the procedure that has been mentioned to see if it gets closer and workable on cw, but been playing with the KN-920 as well and making notes of problems with that rig.

Now I do digress:

Been milling through some of the old emails in my X1M folder and not sure if anyone has seen it or mentioned it but the RIT moves transmit as well and not just receive, I tried working a station on 20 meters this morning and figured I would transmit where I zero beat with my other receiver and then just tune down so I hear him calling me and to my surprise transmit again moved. If the split function worked on cw then there would not be an issue or even the RIT, but takes a long time to move the RIT

Ok off to town and then play a bit more.

I just uploaded the schematic of my connections to the files section. Sometimes a picture is worth a thousand texts!

--- In x1m_qrp-transceiver@yahoogroups.com, <orders@...> wrote:

Awesome Bruce! I know mic *has* a red led on the front but I don't think I've seen it come on when I TX. I wonder if my LED is not wired up right and reducing the output of the mic... much like your computer mic without the led in series... I'm going to have to dig into this one. Thanks for the hot tip!/ring/sleeve! (couldn't pass up the bad pun...)

--- In X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com> wrote:

THE MICROPHONE PUZZLE IS SOLVED!

I read all the recent discussions about digital mode hookups and the light went on for me when somebody mentioned the bias current being incorrect. That's when it hit me: the X1M needs the extra current draw from the PTT LED in the mic! As soon as I added a red LED in series with 4.7k between tip and ring of the mic plug, my PC headset mic started working.

I now have a very nice little adapter to use my PC headset on the X1M. Here are the final connections:

X1M Sleeve ------------------- (GND) ------------------ Mic Sleeve

X1M Ring ------------ Pushbutton --------- GND
X1M Ring ------------ |< -LED+ ------- 4.7k ----- X1M Tip

X1M Tip ----------- Mic Tip & Mic Ring

The pushbutton acts as PTT when I'm using the headset. When I get around to it I'll add a NO jack across the pushbutton for a foot switch and have full hands-free operation.

Hope this helps anyone who's trying to do something similar. Give me a shout if you have any questions.

--- In x1m_qrp-transceiver@yahoogroups.com, <ko4xl@...> wrote:

OK, so last night I bit the bullet and completely traced the circuitry inside the stock mic. The only additional components are:

- A .01uf disc cap across the mic cartridge. I assume this is just there for RF bypass and high frequency rolloff. It shouldn't be required for the mic to function, right?
- A 4k7 resistor in series with an LED between tip and ring. This is obviously the transmit light on the front of the mic.

There are a few other items related to the disabled speaker in the stock mic. For the X1M, none of these are ever in-circuit.

After looking at all this, the only conclusion I can reach is that the stock mic cartridge has much higher output than a PC headset mic. Before I go hunting for a mic preamp, could somebody please prove me wrong?

>
> I've dug a little deeper and am still having no success. Here's what I know so far:
>
> Opening the stock mike and using an ohmmeter, I see that ring goes to the PTT switch and tip goes to the mike cartridge. (The other side of both the switch and the mike cartridge are tied to sleeve (ground). At the radio, when PTT is grounded (active), tip goes from open circuit to about +7 volts (relative to sleeve ground). I assume this is the bias voltage needed to power the electret cartrige in the stock mike. However, hooking a different electret cartridge (from a pc headset) across tip and sleeve (yes, I got the polarity correct!) and grounding ring (PTT) does not give me any audio. What am I missing?

Hello Heath.

Can you please give us a little more info on the results?

Although you found the serial number has changed to FFFFFFFF, does the radio work? If there have been improvements and/or changes we would all love to know. Personally I am not concerned if it is only the SN that is not displaying correctly. If the radio does in fact work with the new FW, then the group would be keen to know if problems relating to CW offsets, etc are resolved.

Also, have you tried the "Re-Writable" button (the third software button from the left?) I wonder if this is used to set the S/N???

Thanks for putting your hand up to test this stuff - it is greatly appreciated!

Cheers,

Perrin

Gang,

1. It appears that since the Dayton Hamvention, the X1M which I purchased there has been superseded by something new but not necessarily better. (No, I don't check in that often.)

2. If there is a new downloadable firmware that would turn my X1M into the radio it should have been before I bought it, I'd like to know (a) where it is and (b) if it works.

3. I suspect that the overheating/going-out-of-lock DDS VFO problem (which resulted in my putting a slice of tin on the VFO IC to cool it off & thus stabilize things) has not been addressed by the manufacturer.

4. If there was a "here's mine/fix it & send it back to me" program, that would be nice too.

5. In consideration of all of the above, I have a few options: (a) I put it in my range bag for the next time I want to scare myself with Soviet era firearms; (b) I take my lumps & try it out every once in a while just to remind myself that I spent $300 on it; (c) I put it in the box with all the other esoterica that I'm saving for the estate auction; or (d) I try to sell it. And option (e) I give it to someone to run options (a) through (d) on their own.

Unless, of course, items in paragraphs 1. through 4. are addressed in some manner that would resolve my having to consider paragraph 5.

Given my serial number was 13 (unlucky?) I was on an older firmware dated 18th July. What appeard to happen was it updated the firmware to 20th july version, which I suspect most X1M PRO users out there already have. As such, I suggest that if your firmware is already dated 20th July, don't bother with this update. If however you're on the 18th July firmware, it *MAY* be of benefit to upgrade though I don't recommend it as it will void your warranty with little potential to gain.

I haven't noticed any other 'issues' other than the FFFFFF serial number, but I haven't done any extensive testing to confirm/deny this.

Heath,
I guess that this is good news, in a way. Perhaps a revised firmware to correct the July 20 version is coming soon. From what I have heard, the July 20 version broke some things which used to work. Maybe they will get it right this time.

Nils,

Do you really find the original X1M all that bad? True, it's not up to the level of any mainstream QRP radio, but you also paid a fraction of the mainstream price.

Personally, I'm having a ball with my "original flavor" X1M. I'm not trying to win any contests or collect any wallpaper with it, but I've made plenty of QSOs on multiple bands in both CW and SSB, all with just low dipoles and a little patience. I'm currently building a little audio filter (NEScaf from New England QRP Group) to help separate CW stations and a mini longwire tuner (SOTA from qrpkits.com). The goal is a small, lightweight setup that I can pack when I go camping with my son's Boy Scout troop.

Maybe you need to ask yourself if what you really wanted was something like a KX3 or a FT-817. If yes, then eBay your X1M to someone who will appreciate it for what it is and put whatever you get for it towards the kilobuck that one of those rigs will cost you.

Sorry Guys, I'll try this again. My last post didn't go through.

Several hams and myself are still waiting for Kight Radio to get their shipment of X1M's in. I sent my second radio for return more than a month ago and I'm still waiting for the replacement. I know Dale of Kight Radio is not at fault here, it's the Chinese manufacture. My second return radio had no output on 10 meters. It was probably a bad solder joint and I could have fixed it myself, but because it was under warranty and I sent it back. The last time I talked to Dale was three weeks ago he said he was expecting the radios in any day now. If anyone has an update from Dale on the status of these radios I wish they would relay the information to all of us here in the group. It's getting to the point where I wish I had my previous X1M back and I could repair it. In my opinion the original X1M could be brought back up to specs for region #2 with the software upgrade. IMHO if the Chinese manufacture the X1M is having this much trouble with the 5 W rig, then nobody's going touch the 20 W rig when it comes out.

Gary & All,
Please be patient. I like to think the delay may be due to the manufacturer not shipping any more units until they get the firmware right. The most current X1M firmware I am aware of is dated July 20 and has some serious problems. Those of us who have these units can use them, but they are severely crippled and need a firmware update to be fully functional up to the limits of the hardware design. We (those of us with current model rigs) think the major firmware problems have been identified and hope that the manufacturer is working to solve them AND have the corrected firmware verified by a competent ham (who understands what the firmware is supposed to do) BEFORE they ship additional units. Time will tell.
I have no connection with the company or any distributor and am privy to no inside information. I'm just an optimistic owner.

Fred,

I highly doubt that this supposed 'NEW' firmware which several of us have just just tried is actually 'NEW'. Whilst it's been 'newly' available for us to do the 'upgrade' ourselves, it's dated 20th July, so it's the same date that perhaps most PRO users have anyway, now some 6 weeks old.

I've been providing the factory with feedback on most points people have been discussing on this list, as well as points people have emailed me privately. Many of these points have been in the last couple of weeks, and some as recent as last week.

I doubt that we will see a firmware update made public for quite a while, though fingers are crossed that the latest shipped radios will already have corrected firmware.

A point to note here, is that the firmware has NO EFFECT on the alignment settings, so a firmware update will not automatically fix the issues with IF Offset's and the terrible default LSB BFO settings.

Ken,

I'm curious to know what in the latest version of firmware is so
'cripling'?
There are many operators using their X1M PRO daily with successful results.
After increasing the mic gain, re-aligning the IF Offset and LSB BFO, I'm
quite happy with the radio.

Dale -- are you looking to add a 10 uf cap across pins 1&8 to get the lm386 to the '200' or 46 db level? I just happen to be reading about the lm386 about when I saw this email and laughed a bit. Anyway -- I haven't checked the schematics of the rig yet to see if they are running on the 26 db gain level but your email makes me thing they are.

Hope that's the case. How pulling it all apart is not to bad. And I hope dropping a cap/doing the mod is easy and works! That would be fantastic news!

Hi Heath,

Thanks for everything you are doing to communicate back to the factory for all of us -- I personally really appreciate knowing that someone who is active in both communities is actively participating around here. So a big old hat tip to you from me!

I'm curious to know more details about why the firmware has no effect on the alignment settings? I'd appreciate a deeper understanding of that sentence. You can PM me if you like or post it here. Give it to me in all the technical/electrical details!

Anyway -- thanks again,
-Chris

Fred,

I highly doubt that this supposed 'NEW' firmware which several of us have just just tried is actually 'NEW'. Whilst it's been 'newly' available for us to do the 'upgrade' ourselves, it's dated 20th July, so it's the same date that perhaps most PRO users have anyway, now some 6 weeks old.

I've been providing the factory with feedback on most points people have been discussing on this list, as well as points people have emailed me privately. Many of these points have been in the last couple of weeks, and some as recent as last week.

I doubt that we will see a firmware update made public for quite a while, though fingers are crossed that the latest shipped radios will already have corrected firmware.

A point to note here, is that the firmware has NO EFFECT on the alignment settings, so a firmware update will not automatically fix the issues with IF Offset's and the terrible default LSB BFO settings.

From: <orders@...>
Topic: 1277 Message: 1290

I stand corrected -- looking at the original schemastics I finally found it. Looks like they've got the cap and resister jumping those pins which sets it at the '50' level about or at least between 20 and 200. So I'm going to guess your mod is to remove the resistor from the circuit and let it go to '200' with just the cap in series.

I'm really enjoying playing 'guess the mod'! It reminds me of how I learned computers -- I'd break them while my dad was at work. Things like delete the entire windows 3.1 directory, or set a password on a screen saver and then forget it, etc. When my dad would get home he'd call my uncle who would come over and fix it. So I started to basically try and guess how to fix it before he would get home so my uncle didn't get called. For some reason trying to guess your mod before you tell us sort of reminds me of that learning process.

So it goes.

I wonder if my LED is not wired up right and reducing the output of the mic... much like your computer mic without the led in series... I'm going to have to dig into this one. Thanks for the hot tip!/ring/sleeve! (couldn't pass up the bad pun...)

-Chris

--- In X1M_QRP-Transceiver@yahoogroups.com, <x1m_qrp-transceiver@yahoogroups.com> wrote:

THE MICROPHONE PUZZLE IS SOLVED!

I read all the recent discussions about digital mode hookups and the light went on for me when somebody mentioned the bias current being incorrect. That's when it hit me: the X1M needs the extra current draw from the PTT LED in the mic! As soon as I added a red LED in series with 4.7k between tip and ring of the mic plug, my PC headset mic started working.

I now have a very nice little adapter to use my PC headset on the X1M. Here are the final connections:

X1M Sleeve ------------------- (GND) ------------------ Mic Sleeve

X1M Ring ------------ Pushbutton --------- GND
X1M Ring ------------ |< -LED+ ------- 4.7k ----- X1M Tip

X1M Tip ----------- Mic Tip & Mic Ring

The pushbutton acts as PTT when I'm using the headset. When I get around to it I'll add a NO jack across the pushbutton for a foot switch and have full hands-free operation.

Hope this helps anyone who's trying to do something similar. Give me a shout if you have any questions.

Bruce

--- In x1m_qrp-transceiver@yahoogroups.com, <ko4xl@...> wrote:

OK, so last night I bit the bullet and completely traced the circuitry inside the stock mic. The only additional components are:

- A .01uf disc cap across the mic cartridge. I assume this is just there for RF bypass and high frequency rolloff. It shouldn't be required for the mic to function, right?
- A 4k7 resistor in series with an LED between tip and ring. This is obviously the transmit light on the front of the mic.

There are a few other items related to the disabled speaker in the stock mic. For the X1M, none of these are ever in-circuit.

After looking at all this, the only conclusion I can reach is that the stock mic cartridge has much higher output than a PC headset mic. Before I go hunting for a mic preamp, could somebody please prove me wrong?

> Opening the stock mike and using an ohmmeter, I see that ring goes to the PTT switch and tip goes to the mike cartridge. (The other side of both the switch and the mike cartridge are tied to sleeve (ground). At the radio, when PTT is grounded (active), tip goes from open circuit to about +7 volts (relative to sleeve ground). I assume this is the bias voltage needed to power the electret cartrige in the stock mike. However, hooking a different electret cartridge (from a pc headset) across tip and sleeve (yes, I got the polarity correct!) and grounding ring (PTT) does not give me any audio. What am I missing?

Hi Nils,

If those are your options I think you are still squarely in the #5 paragraph options but let me answer your questions directly first.

1) Yes - that is true. From what I can tell it is 'mostly' a head unit/display upgrade and the firmware to support that. There are other changes isn the firmware as well. And yes it isn't 'perfect' either.

2) Nope. No new downloadable firmware yet for the ver II (or PRO for that matter). If you are willing to parse our your sentence more about what make is not the radio 'it should have been' for you... there might be some tricks and tips from folks to help minimize those down to a few firmware/hardware pieces. I know going back through the past messages if you haven't been reading them is like finding a needle in a haystack. I personally and more than happy to point people back to things that already have been said if they can't find them.

3) This one I don't know. I do remember reading somewhere that when running at 13.8v it was getting really hot but at 12v it was much cooler. If you are running at 13.8vs you might try 12v and see if the problem is just as bad. I'd actually be curious to know the answer even if you decide not to keep the rig.

4) Also not that I know of. If it is broken, broken broken as in bad solder joints, etc. I know Ed and Dale have been dealing with those. But for the firmware and reduced 40m band coverage, low audio, etc. nothing that I've heard of yet.

5) I can't say much to this one except I really hope you'd sell it or give it away if a & b are you main options. I personally am having a blast with the exact fact that the little rig isn't perfect. It is giving me a reason to dig deeper into understanding radios on the circuit level! I'm new to HF and if I started with a working rig with buttons it would just be a button push to get my compressing in my audio... instead I'm sitting here locating an IC and design/copying a circuit around and it learning about each step of what each piece does. I know that takes time and it isn't how everyone is looking at the rig but I got to believe there are a few of out there. So if you decide the rig doesn't match what you want and you decide not to go 'Office space' on it .... find a ham who wants it for what it is. If you are willing to part with it a little cheaper than you paid or for free I know someone who might be interested in it. PM if that is the case.

Gary & All,
Please be patient. I like to think the delay may be due to the manufacturer not shipping any more units until they get the firmware right. The most current X1M firmware I am aware of is dated July 20 and has some serious problems. Those of us who have these units can use them, but they are severely crippled and need a firmware update to be fully functional up to the limits of the hardware design. We (those of us with current model rigs) think the major firmware problems have been identified and hope that the manufacturer is working to solve them AND have the corrected firmware verified by a competent ham (who understands what the firmware is supposed to do) BEFORE they ship additional units. Time will tell. I have no connection with the company or any distributor and am privy to no inside information. I'm just an optimistic owner.

I too bought an X1M at the Dayton show. While I was able to adjust the frequencies of the various offsets to get the radio usable on both sidebands, and get the sidetone and mic level adjusted, the radio is still not usable on the upper sections of the 75 and 40 meter bands which is important to me.

The most recent word from the dealer is that since the radio met the published specifications, he cannot accept it for refund or exchange for a radio that covers the bands fully. I do not consider this acceptable, as he told me that the radio has transmit filters for the 80, 40, 20, 15, and 10 meter bands, and I don't think it unreasonable to have assumed that he was talking about the US bands. As far as any specs, there was nothing - I was given the radio in a plain white box, no manual or specs. So all I had to go by was what was said verbally.

For $300 I learned a lesson: Now I know not to buy anything from Import Communciations. So far that has only benefited my employer, though. We were shopping for a considerable number of VHF portables this year and Import Communciations would have been one of the likely sources. After the experience with the X1M instead I turned to Main Trading Company. Two of the portables did not do what was expected of them and they were replaced with good units within three days. That's the way to handle such problems.

Hello Gary and Folks,

I'll second the head's up on any info from Kight Radio or elsewhere. Dale's last reply was August 20, and that was saying the radios were due in within a week or less. I'm going to give it another week or so from now before I ask Dale again. But yeah, this wait is getting a bit long now.

I had a radio in hand back in May. I also could've done a fix, but a warrantee is a warrantee. I really wanted to play around with the radio this summer. However, it looks like it may be closer to Fall before I might get a replacement . . . and I'm being hopeful here. So yeah, any heads up info from anyone/anywhere would be great. For $300, I knew the radio wouldn't be a perfect from the get go. However, this whole process of waiting has started to sour me towards it a bit. I'd rather have a radio than my money back. I'm very patient, though I do have my limits. Sorry for the rant here folks.

So . . . any success stories with the rig? That might be nice to hear in the mean time between the issues and such.

Take Care,
John Golub

No, this mod involves a series RC to ground from pin 1 and then another series RC to the output. Gains up to 74dB can be achieved with this technique- but stability becomes an issue when pushing to the hi end of this range.

Subject: [X1M_QRP-Transceiver] RE: X1M Boards

I stand corrected -- looking at the original schemastics I finally found it. Looks like they've got the cap and resister jumping those pins which sets it at the '50' level about or at least between 20 and 200. So I'm going to guess your mod is to remove the resistor from the circuit and let it go to '200' with just the cap in series.

I'm really enjoying playing 'guess the mod'! It reminds me of how I learned computers -- I'd break them while my dad was at work. Things like delete the entire windows 3.1 directory, or set a password on a screen saver and then forget it, etc. When my dad would get home he'd call my uncle who would come over and fix it. So I started to basically try and guess how to fix it before he would get home so my uncle didn't get called. For some reason trying to guess your mod before you tell us sort of reminds me of that learning process.

So it goes.

Hello Group,
While looking at the area around the LM386 I thought I would measure the resistor (R80C) that is in series with the 10uF electrolytic (C155C) between pins 1 and 8. The schematic shows 470 Ohms, so initially I had dismissed the mod that Chris mentioned as not being worthwhile because of the low gain improvement. It turns out on my Pro version at least the resistor is 1K. By shorting it out I got exactly 12dB of gain. Now, while there is likely still not enough system gain for AGC, it does make the rig much more lively (at least on my signal generator) with the internal speaker. No signs of instability. R80C is on the bottom of the top board and C155C is also on the bottom to the right of the LM386. Both are accessible without having to separate the boards.
I soldered a piece of #30 wire wrap to pin 1 on the bottom and a 2nd piece to the (+) side of C155C (10uF). By shorting these two together I could easily measure the voltage gain.
I'll put a jumper across R80C and see what it sounds like on the bands.

Chris- thank you for mentioning this mod, otherwise I likely would have dismissed it as not yielding enough gain.

More to follow,

Dale W4OP

Thanks Bruce! I appreciate you sharing with the group! I haven't hit the point yet where this is helpful but I do know its coming. As I'm working on the audio compression circuit my buddy and I have talked about just going all out and making a whole new mic... and if we play with that idea-- this will be super helpful!

Thanks for sharing and enjoy your new setup!

THE MICROPHONE PUZZLE IS SOLVED!

I read all the recent discussions about digital mode hookups and the light went on for me when somebody mentioned the bias current being incorrect. That's when it hit me: the X1M needs the extra current draw from the PTT LED in the mic! As soon as I added a red LED in series with 4.7k between tip and ring of the mic plug, my PC headset mic started working.

I now have a very nice little adapter to use my PC headset on the X1M. Here are the final connections:

X1M Sleeve ------------------- (GND) ------------------ Mic Sleeve

X1M Ring ------------ Pushbutton --------- GND

X1M Ring ------------ |< -LED+ ------- 4.7k ----- X1M Tip

X1M Tip ----------- Mic Tip & Mic Ring

The pushbutton acts as PTT when I'm using the headset. When I get around to it I'll add a NO jack across the pushbutton for a foot switch and have full hands-free operation.

Hope this helps anyone who's trying to do something similar. Give me a shout if you have any questions.

OK, so last night I bit the bullet and completely traced the circuitry inside the stock mic. The only additional components are:

- A .01uf disc cap across the mic cartridge. I assume this is just there for RF bypass and high frequency rolloff. It shouldn't be required for the mic to function, right?
- A 4k7 resistor in series with an LED between tip and ring. This is obviously the transmit light on the front of the mic.

There are a few other items related to the disabled speaker in the stock mic. For the X1M, none of these are ever in-circuit.

After looking at all this, the only conclusion I can reach is that the stock mic cartridge has much higher output than a PC headset mic. Before I go hunting for a mic preamp, could somebody please prove me wrong?

tip goes to the mike cartridge. (The other side of both the switch and the mike cartridge are tied to sleeve (ground). At the radio, when PTT is grounded (active), tip goes from open circuit to about +7 volts (relative to sleeve ground). I assume this is the bias voltage needed to power the electret cartrige in the stock mike. However, hooking a different electret cartridge (from a pc headset) across tip and sleeve (yes, I got the polarity correct!) and grounding ring (PTT) does not give me any audio. What am I missing?

THANKS Dale !!

I have a kind of off topic question here .

Is there anyone on the group that maybe even has some type of printing business ? I would like to get very much enlarged copies of the present and future diagrams , to hang on the wall at the bench . Actually I would buy a couple of each. One for a working copy and one to laminate for a "clean copy."

I have vision problems at certain distances and it would sure be MUCH easier for me if I can buy some large diagrams .

I plan on having this radio for a long time and also later , doing some mods to it . I purchased mine to use as an exciter on the experimental bands and the ham bands are a very nice bonus in my case .

By the way I live in quite a rural area , so I don't have any of those companies anywhere close to me that do the kind of printing that I need done , so I am open to suggestions from the group too .

1304. Increased RX Gain

Yahoo group: X1M_QRP-Transceiver (2013)
Date: 2013-09-08 01:29:08 UTC
From: Dale Parfitt
Topic: 1304 Message: 1304

I have been using the XM1 for an hour or more tonight on 40M CW and SSB- just listening and see no ill effects of shorting resistor R80C. I am able to reduce the AF Gain by more than 90 degrees from the position it was in before the mod.
As soon as I get time, I'll breadboard a dual op amp AGC conditioning circuit.

John -- I'm not sure. I haven't traced the schematics to see where it all ends up but I would go with -- that is entirely a possibility.

Dale - Interesting! I'm certainly looking forward to how it works. I'm still scratching my head on what that exactly does electrically as I'm newly digging into all of this but it gives me one more thing to tease apart so thanks!

Hi Chris,
If you look at what is inside the 386, you will see a 1.35K (?) internal resistor that effectively sets the gain of the amplifier. By placing a large cap in parallel, you give the audio another path (lower impedance in this case) to follow and increasing the gain. By choosing different values, you can shape the audio response. Smaller values will reduce low frequency gain. By placing a resistor in series with the cap you add another break point in the audio spectrum- the gain will increase as you go up in frequency until the capacitor reactance is much less than the external series resistor and will then flatten out.
At least that is my understanding and if incorrect- please correct me.
Anyway, there is now lots of gain and I am running the volume just cracked open- probably enough for AGC now w/o further audio chain mods.
The little rig continues to impress me.

Dale W4OP

Dale - Interesting! I'm certainly looking forward to how it works. I'm still scratching my head on what that exactly does electrically as I'm newly digging into all of this but it gives me one more thing to tease apart so thanks!
